The operating system should protect your from application errors. Try running
a UNIX variant or, if necessary, NT. Also, I have a PII and it feels very
snappy to me. I can live with waiting 2 seconds for Word to load up.

That depends of your coffee maker. If you have one which can be programmed to start at a particular time then it may well have a microprocessor. But I'll give you another example, a car ABS system is microprocessor controlled but I'm fairly sure that it doesn't run an operating system. At KD Engineering, we make air quality data logging systems that are controlled by > 10,000LOC but they don't have an operating system.

Doesn't your school have dial-up access? A few kilobytes of source code should
be transferable in under 10 seconds.

> The cost of a floppy isn't high, especially not when compared to its utility.

For some people, the floppy has zero utility. Apple is probably hoping that
these people will be attracted to the iMac.

Ethernet or, worst case, the modem. Doesn't everyone have at least modem
access at home and at work/school these days?

No. You don't need a LAN at home. You can use the built-in modem for
transfering small amounts of data. BTW, could you please call be Brian?
Quinlan has negative conotations for me.

In what respected publication can I find this definition? The two most
respected definitions (used by most reference works) of an operating system
are the "resource manager" and "extended machine" definitions. DOS may not
satisfy the former definition. The Mac OS, however, would be considered an
operatings system by both definitions.

tr> all of those things too... just with a little more emphasis on the
tr> word-processing aspect. I could go on, but I won't.

bq>So what are you arguing for? Component software architectures? Less capable
bq>software?

Upon reflection, maybe I am. It depends upon how you define
capability. Just give me the tools I need to accomplish a specific
task. I know how to load, run and use other programs. A full-fledged
spelling and grammar checker and a complete drawing program (as
opposed to a graphing routine) as an _integral_ component of my
/spreadsheet/? Yeah. Right. And I have an Oxford dictionary,
Columbia Concise Encyclopedia, Rogets Thesaurus, Chicago Manual of
Style and a fully equipped drafting table permanently affixed to the
calculator on my desk --- with individual copies of this package
attached to both my pen and my index file (you never know, after all).

Simply put, I don't got to a library expecting to be able to buy my
groceries while the librarian is pulling my car into the reading room
to repair my transmission. And, for the life of me, I simply can't
remember the last time that I went to a travel agent to pay my
telephone bill.

All of these layers upon layers upon layers simply bog the computer
down and make it more susceptible to crashes. As I mentioned in
another post: mysterious lock-ups, routine crashes, and sluggish
speed. Tell me how long you would blithely ignor a videocassette
reorder that always mysteriously stopped in the middle of recording or
playback? Suddenly just died, routinely turning itself off whenever
you tried to use it ---with a high probability that it would also eat
your tape, fry your television, and somehow or other make your
doorbell turn your bedroom lights on and off? To top it all off, when
it wasn't doing all of this, it would only play your tapes at 1/3
speed (and then only if they had been recorded in a VCR made the same

year). How Long? The strange thing is that this seems laughable to people - they would have that VCR back to the store within minutes. Yet they accept the same thing on their computer as a matter of choice, just calmly rebooting and waiting for the next crash. Sorry, but I know more than enough ways of making a computer crash - I don't need any automatic crash systems cluttering up my desk.

>bq>software?

Component software architectures? In my opinion that has become
merely an apologists bugaboo boy that is no longer faithful to its
original (valid) context.

There is nothing wrong with components or compartmentalization per se.
Indeed, everyday life is replete with examples of where this is not
only satisfactory, but a more effective approach.

Witness the capabilities of audio components when compared to even the
best boom box. Compare a large format or 35mm SLR to a do-everything
point and shoot camera.

Or even closer to home, consider your bathroom. How many people do
you know that want to use this area to cook dinner? Now, I might want
to read something while I'm using the bathroom, in which case I would
"import" a book. I most certainly wouldn't spend money to buy or
install a bathroom with a fully-stocked library, or facilities for
printing my own book.

ahh, the typical TIFKAS trait - if you run out of arguments, start an ad-hominen smear campaign against someone who is clearly winning the debate.

For the record, I have kissed a girl. As a matter of fact, I was nearly married (and the reasons why I didn't go through with the marriage is no concern of yours or anyone in this forum - this is a computer forum, after all). Currently I am dating no one, although my prospects are looking up with at least one woman who works in the same building as I.

I also don't live in my parents' basement - I live in somebody else's basement :) AAMoF, I'm currently looking after the house for my landlady.

I also don't make a habit of claiming that
I'm a macho stud - in fact, I respect women and they respect me. Including feminists. You know, TIFKAS, the women who you're so afraid of that you make misogynist remarks about, just like your hero Rush Limbaugh.

Hopefully, TIFKAS will change his tune when the next woman who he tries to treat like an "inflatable" turns out to be a "bunny boiler" :)

yep, at least they'll be able to print in one month when the Epson
printer comes out. And they'll be able to back up their files to the most

popular removable media by January. But I guess drooling fanboys don't
really think about those issues, do they .....

It's been an imac weekend at CompUSA.. I have read
>that Computer City in CANADA sold out the imac...

funny that Computer City's weekend flyer in the Toronto Star didn't
mention anything about the iMac anywhere. We can thank InCompUSA for
that one.....

CompUSA needs all the help they can get, seeing that they lost $50M
in the last quarter (on top of that big loss they had on the previous
quarter)....

Can't imagine why - the iMac was priced here at $1,929 Canadian
dollarettes while the G3 was advertised at $2,125 with monitor - maybe
they only had 1 available - but why go for an iMac unloaded when you
could get a 'real' G3 for only 200 Canadian Pesos more ?

The Canadian Curmudgeon (in sunny, humid, Calgary)

You have no idea as usual. Initialy, Iomega stated that the Zip would not be
available until November time frame but subject to change. My customers were
told of this with availability subject to change.

Looks like Computer City needed help to...thats why Comp gobbled them
up...Looks like a charge will be needed.

CompUSa's current woes are softness of wintel sales in spring/summer and lower
average selling price. The imac was their biggest selling computer ever over
one weekend..

> >

>So your stalking this girl(?)..

my my. First with claiming I have a criminal record (which I don't) and then suggesting I would stalk women to ultimately harm them (which I wouldn't). As well as trying to claim I'm gay, which is a) not true in any case, and b) wouldn't matter even if I was (you know, I'm beginning to detect a bit of homosexual panic in Mr. TIFKAS' postings). No, this woman and I are having some nice conversations and we have mutual respect for each other, and I'm going to ask her out.

You know, spreading innuendo about a person is bad form (shows that you're running out of arguments), and could lead to some nasty repercussions later - like a nice letter to your ISP and my-dejanews about slander. I think we can start by starting to cross-post your replies to me to alt.usenet.kooks - it hasn't been the same since Earl Curley died, and they need someone to laugh at, and it might as well be you.

>

you started by making disparaging remarks about "whining" feminists
and comparing them to Atari users. My, what a hypocrite. You claim to
hate Rush and Republicans, and yet you use their same tactics, like
referring to Atari users as "the Atari Jihad", referring to us as
"boobs" and making up stuff about Atari and TOS up from whole cloth. My
a nice plasticine mind you have. Unfortunately, the tactics aren't
working, no matter what new tactics you use to weasel out of your
situation.

Ironically enough, Al Franken shoots down all sorts of pompous
asses in his work other than Rush - and you'd be a prime target for his
satire. Maybe a nice psychiatric session with Stuart Smalley ("sorry,
Peter, but Cleopatra isn't the only Queen of Denial").

And no wonder you want to vote for Bill Clinton - you're now BOTH
known fibbers who should be immediately bounced from their jobs,(I heard
Clinton's self-serving speech last night, and the turkey should do the
right thing and resign). At least our Prime Minister keeps his pants
on......

Hi Winguy - thought you might enjoy these little tidbits.....go to dash off now and add a few new links to my Mac Favorites page on the Web....

Tom

Apples tendency to shoot itself in the foot over QC/QA is already starting to surface with the iMac. The modem, mouse and CD Rom are turning out to be a little problematical. A few printing and software issues have also shown up.....the next week or so could be very interesting, and will tell us once and for all whether this "bet the store" machine is for real or another Apple fiasco.....

From: http://macsupport.miningco.com/blcenter.htm

Don Russel reported just got the iMac home, everything great, except the CDrom. The three pins around the spindle don't retract upon opening the CD drawer.

snip

Shaun Opp reported I haven't been able to get Quake to recognize my mouse, perhaps because it's a USB device. I've tried the "+mtools" command line in the game which is supposed to let you aim with the mouse but no go. When you select the "Mouse/Joystick" radio button under options, it says you have no devices to configure. No reports yet on MacSofts website. Also placing pressure on the iMac CD tray results in my monitor blipping out similar to a degauss on a normal monitor.

Ken Glinka reported I am having a hard time connecting or staying connected to my ISP (Netcom). The iMac modem will connect and then it will hang when it tries to start PPP, then it tells me that the remote server is not responding and disconnects me. When I do connect I will either have no problems or get disconnected very quickly. I have talked to Netcom and they are not sure. I have everything setup like my Performa 6400/200 (PPP).

Jeff Rawlings reports I can't connect to aol w/ the imac modem. It keeps timing out on me. I've tried different/slower access #'s. I suspect aol and the new mac modem are having trouble talking. If this is a common problem, the imac is in big trouble right out of the box. Boy do i hate that. :((

From: http://www.macfixit.com/imac/

Imaging the ROM into RAM takes up 3 mb of precious RAM:

A minus: less RAM available Hardware-specific code that performs the computer's startup activities resides in firmware (ROM). That code fits into one ROM called the Boot ROM. All higher level software resides somewhere else, largely in RAM. This removes approximately 3 megabytes of RAM from Mac OS usage. In effect, a system with 32 megabytes of RAM appears to have only 29 megabytes available.

It's hard to get into:

Getting inside A Macworld review notes that getting inside the iMac is "hardly brain surgery, but it is dramatically more complicated than some of Apple's earlier designs for Performa and education-oriented systems." Meanwhile, iMac2Day's Visual Memory Upgrade Guide shows how to upgrade your iMac's RAM. An Apple TIL file covers similar ground.

From: http://www.macfixit.com/imac/imac-t1.shtml

Printer compatability issues

Epson Monitor3 memory Evan Matiatos had problems getting the new driver to work with his Epson printer and iMac, using the Epson USB / Parallel Adapter. Even turning off background printing (as suggested in the manual) did not work. He found that increasing the preferred memory size of the Epson Monitor3 file (located in the Extensions folder) from 1Mb to at least 2Mb did the trick. This worked on three iMacs.

Jeff Ashmann had similar printing problems with his 2 iMacs and Epson 600s. "It will print half a page, single lines, dashes, all kinds of garbage. We are unable to print anything usable."

and from the same page, multimedia problems:

Movie glitches? Flip Russell had problems with the playback of Cinepack compressed movies. For some reason, disabling the included AOL Scheduler startup item solved this problem. "I'm also getting 'not enough memory' errors from MoviePlayer when I try to play Sorenson compressed movies. Haven't found a workaround for that yet."

Quite a list for only 48 hours and a few thousand machines......time will tell!

Tom Elam

The universe is not only stranger than we imagine,
it is stranger than we CAN imagine.

[time warp ON...]

Does anybody know of any desktop TV apps dating back to the early 80's?
I'm looking for something which would have displayed a TV program
schedule and allowed the user/viewer to select what to watch.

In particular, which of the early computers (TRS-80, Apple][, Atari,
Amiga...) was the first to provide such a capability?

Any info much appreciated!

Yep I have with good reason. Feminism is a genear term that can be defined
in so many ways or use it to hide behind it for agendas. There are some
scary feminish groups that are on par with the religious right republicans
who want to censor - what we read and view that may have percieved anti
family messages and visuals that may show women in a pornographic light.

Clinton is directly elected and can't be bounced except for treason. I am disapointed that its gone this far that could of been settled last January. Its come down to this that the special prosecutor found no wrong doing in WhiteWater but wants to nail him for dropping his pants for pleasure after days of work grind. Whats next?

I personaly think he should step aside so he can deal with this nonesense. Lets face it, Clinton is a lameduck..The Gore administration should get a head start.

The iMac. Apples newest household appliance. The latest Apple design will fit quite nicely next to your old Mac Plus, but adding a little color to your kitchen. Yes housewives, the latest technology is right at your finger tips. This little jewel will compliment most kitchen accessories that you just couldn't part with from the 50's. No need to worry about printers taking up space, or the kids wanting to play Doom while your baking your (sic) Apple pie in your kelm. The designers at Apple thought of these things for you and incorperated them into one single package which will look nice next to your blue gravel fish tank.

Really people, take a close look at this thing. It's an advertising joke. Only in America.

The best use of the iMacs will come when Back to the Future VIII is released. It will fit nicely next to the Mac Plus in the Antique dealers window..... Looks like history does have a way of repeating itself.

< much personal attack lacking in computer debate snipped >

obviously, folks, there rests my case. Sinclap, realizing that he can't outshout me, intimidate me, or outthink me, has sadly been reduced to spreading innuendo about me. And quite lamely, too - after all, anybody who would think that being the vice-president of a computer club is something to be ashamed of obviously has some personal issues to deal with. Anyone who would try to take this into a forum completely unrelated to the issues at hand (as TIFKAS has when he took it to alt.nerd.obsessive and wound up posting his usual drivel and denials to it, thereby causing its denizens unnecessary wasted bandwidth that would've been put to better use as a get-rich-quick scheme posting) is in dire need of professional help.

TIFKAS, you have sunk to a new low. If you can't stick to the issues at hand which is the main thrust of this forum, then shut the hell up. And the issues are whether or not the iMac has merit as a computing platform, whether Atari is still a viable platform as we head to the year 2000, whether the Milan changes things regarding the future of the Atari platform. Not my weight, not my love life, and certainly not your overt attempts to smear me. All it is accomplishing for you is reinforcing you as the greatest laughingstock on the USENET today.

As Senator Barry Goldwater (the last great GOP politician) said to Dan Quayle while he and George Bush were on a similar smear campaign against Michael Dukakis in the 1988 US elections, "go back and start talking about the issues".

As for trying more personal attacks against me - I know of a good way to stop you that will make you look even more ridiculous. Does the term "Doe Snot" mean anything to you? 'Cause I'm prepared to use it now - and it's been proven very effective against loser trolls like you. Your next attack against me will use this technique.....

What degree? Blue screen? I don't see any sort of protection under
Win95. In fact, I feel like I'm not protected at all under Win95, as it's
such a confusion...

The MacOS is an operation system, no matter by how definition.
Jeez... You know, even those clunky internet telephone things have
operating systems. If you can't put that across your skull, then give up,
the MacOS is as real as any other OS out there.

Sorry, I was listing good operating systems not good operating systems with
small memory footprints.

> What degree? Blue screen? I don't see any sort of protection under

Win95 offers memory protection to win32 applications. The Mac OS offers no
form of memory protection to any type of application. All applications work
in a single address space.

> The MacOS is an operation system, no matter by how definition.

No offense, but you need to improve your reading comprehension skills. I was
clearly defending the notion that the Mac OS is an operating system.

Well Brian, everyone is entitled to their own opinion. Whether Atari computers suck or not, they have personality. Which is a lot more than can be said of those nice, safe, bland Apple and PC compatible busses. I've been involved with computers since the mid-70's. I've used and programmed everything from a single-board Sym through mainframes. In my opinion your precious Bloatware Macs & PCs aren't worth a whole heck of a lot. I'd love a nice Pentium II - I'd have the fanciest wheel chocks for my RV in the neighborhood.

I was joking. Still, let's care this on for a while. It might be fun.

Atari computers have no personality at all compared to Macs. Look at all the STs. They look like giant door stops with cooling slits. Except for the ugly case and stupid integrated keyboard, they may as well have been PCs. The original Macs, OTOH, were nicely desiged little units.

And then there was TOS. It was the worst of all operating systems. It wasn't compatible with anything, used the stupid DOS filesystem and the GUI was so disgusting that you felt like using CP/M.

Of course, things have changed. Atari's are now using processors that are slightly better than those in our watches and the operating system is almost half as good as IRIX, linux, BeOS and OpenStep. OTOH, by offering low performance hardware and software, Atari allows the user to stay focussed on the past of computing instead of being caught up in silly crazes like 3D and the Internet.

Peter is a punk. I can even bad mouth better than he can :-)

oh, really? The Macs always looked like those little TVs from the
1950s - the only thing missing was the dials. And why no buttons on the
disk drive? Real diskdrives have buttons and nice bright LEDs. :)

gee, I think the Mac wasn't compatible with anything except other
Macs (and Mac-specific peripherals like printers). Ataris you could at
least transfer your work via their disks to other PCs - and you could
at least plug in industry-standard peripherals (though to be fair, the
Tramiels took several years before they finally put industry standard
SCSI ports on the Falcon. And the way Macs handle
disks - that seems to be pyschologically scarring having to pull the
disk to the trash to eject it. And that Mac operating system - shades
of GEOS if you ask me :)

That's pretty shallow of you Brian. Equating personality to
cosmetics. True Dan - but they weren't even being original in a
computer sense - except for the color of the case it could have been
one of those Vectrex vector-graphic computers that failed early in the
eighties. Strictly cosmetically speaking, the original macs had about
as much personality as an upended breadbox. Now the Banana 2000 in
Bloom County... there was a mac-like machine with personality.

What a concept. In the same sentence you say both that it wasn't
compatible with anything and that it used the stupid DOS filesystem.
From the very beginning I could use any peripheral that I wanted.
That's compatibility that the Mac didn't have. I could access disks

from other Operating Systems. That's compatibility that the Mac
didn't have. So what if it used a proprietary OS? What, precisely,
was Finder, if not proprietary. I had access to emulators for most
machines... 8-bit on up.

Hey. If I want 3-D, I'll buy a playstation. I have it for what I
consider the important jobs on my computer, I don't need real-time
3-D. And what in the world do you think I'm accessing the internet
with? A PC or Macintosh that is misleading everyone into thinking
that it's an Atari?

Compatibility at the cost of having the stupid 8.3 limitation? Why not just
run DOS in the first place? At least the DOS UI was better. And the Mac had a
reason to be incompatible. Apple was actually innovative, unlike Atari was
was just shouting "Me too! Me too!" at the top of their lungs.

> oh, silly me, I must be hallucinating that I'm posting this on the
> Internet. On An Atari. In real time. And who has time for that silly
> overated 3-D when you're getting so much work done :)

The reason we still use usenet is because people with Ataris can't participate
in cool real-time online audio conferences like the rest of us. Atari has
always been behind but now they are actually holding the rest of us up. And
let's talk about browsing. How is the CSS, DHTML, Javascript and Java support
coming? Atari users don't want to play 3D games because the 3D world is too
complicated for them. Hell, most of them only move forward and back when they
play frogger. And 3D work is hard, too hard for Atari users anyway so why add
3D capabilities to the Atari. Maybe in other ten years or so the technology of
yesterday will be available for Atari. But probably not.

Not really. I don't use an Atari any more but I had an ST for several years. I haven't seen an Atari in a while so I couldn't really evaluate their present performance. But I bet that it sucks :-) In the rest of your post, you use the first person too much. That makes it hard to bad mouth the Atari without attacking you personally.

> What a concept. In the same sentence you say both that it wasn't
> compatible with anything and that it used the stupid DOS filesystem.

You couldn't run DOS applications. You were just stuck with the stupid file system.

> From the very beginning I could use any peripheral that I wanted.

Not SCSI peripherals, you couldn't. And getting printer drivers was a problem because printer manufacturers didn't give a crap about Atari.

> That's compatibility that the Mac didn't have. I could access disks
> from other Operating Systems. That's compatibility that the Mac
> didn't have.

Only file compatibility at the cost of using the most stupid file system to ever exist. Instead of blazing new trails like Apple did, Atari said "Hey, we're not smart enough to make our own file system so let's just use the worst one on the market!"

> So what if it used a proprietary OS? What, precisely,
> was Finder, if not proprietary. I had access to emulators for most
> machines... 8-bit on up.

So, why make a proprietary OS that is worst than other OSes on the market? If you can't do it very well, at least do a good job stealing the ideas of others.

> Hey. If I want 3-D, I'll buy a playstation. I have it for what I

> that it's an Atari?

The Playstation isn't going to run SoftImage very well, is it? And consoles are a waste of money anyway. Why buy something that you plug into a crappy TV

when you can see the action at 1280x1024 without paying any extra money? And, if you are willing to spend a few extra bucks, then you can get performance that will destroy any console AND speed up your SoftImage work.

Sure, using your Atari, you can access a small subset of the content available on the Internet. But some of use like Java, JavaScript, Shockwave, Flash, CCS, DHTML, RealAudio, RealVideo, QuickTime, VRML, etc.

Really. And what is wrong with maintaining filesystem compatibility?
Absolutely nothing. It's only people that had a little too much
aluminum in their diets when they were younger that can't keep track
of things using 8.3.

Yup, Apple was being real innovative there. As long as you consider
stealing Xerox Palo Alto Research Centers Ideas part and parcel and
not only claiming them to be your own, but having the gall to try and
sue other companies that attempted to use a GUI.

Atari wasn't shouting "Me too!" Atari had an innovative system
(where, for example, was the color on the Lisa or Mac? - as just one
point). Atari was following its own path but maintaining the lines of
communication with the rest of the world. Whereas Apple was trying to
become a world unto itself.

That's funny, I coulda sworn that I swiped some DOS
software from the PC's in the German department so
that I could run it at home on my ST...

That would be a driver issue, actually... an
entirely separate matter. At least we could
attach them.

...and SCSI peripherals were more than attachable
to an ST. What the ST did have in the way of a busport
was more than adequate for the task and only required
a host adapter (much like a PC would).

Why? Because if you don't need professional color correction
it rather trumps the DOS boxen in interface and the Mac
boxen in price and OS overhead.

Macs used to sell for more than new cars.

Don't let that worry you. For three reasons.
1. I'm a pretty good judge of whether something is a personal
attack or just general commentary.
2. I'm from NYC, and I was a sailor for 15 years, I'm pretty
thick-skinned.
3. Knowing that you don't like Ataris, and that you think bloatware
is fine, I realise that you must just be addled anyway :-)

>> What a concept. In the same sentence you say both that it wasn't
>> compatible with anything and that it used the stupid DOS filesystem.
>
>You couldn't run DOS applications. You were just stuck with the stupid file

Didn't need to run DOS applications. I had perfectly suitable apps on
my own computer. I did, however, need to transfer data and that is
where the file system compatibility was useful, plus the fact that so
many apps were able to save the data in a format that PC or Mac apps
understood - of course, for the Mac you had to find alternative
methods due to that GCR encoding.

>> From the very beginning I could use any peripheral that I wanted.
>
>Not SCSI peripherals, you couldn't. And getting printer drivers was a problem

No, not SCSI. ACSI was close, but not exact. Not that SCSI was such
a big standard in 1985 anyway. There was still no shortage of
peripherals though. I never had any problems with printer drivers.
The only ones that might have presented a problem at the time were the
color printers. I owned two color printers back then. A Star and an
Okidata. Both had Atari drivers.

Sorry, that doesn't wash. All Apple did was restrict people with
their file system and set themselves up for a niche market. GCR? MFS?
HD20? Guaranteed to fry hard disks. HFS was an improvement, but no
great step forward. This is not to say that in essence it wasn't a
better idea for a file system. But let's not talk about not being
smart enough to make your own file system. Unless it was Apples
intention to make a file system that routinely fried peoples hard
disks and made their disks totally unusable by any other computer in
the world. And even with all of the ravaged hard disks, I pity the
people that couldn't afford to buy a HD for their Macintoshes. They
weren't computer users, they were 'carbon-based disk exchange
mechanisms.' No. Apple can hardly be called 'smart' for something
like this.

Hey, I'm no big defender of TOS. It was based on CP/M 68K. But it
did the job that needed to be done. The GUI overlay, GEM showed great
promise, and worked across platforms, until Apple, who had done "a
good job stealing the ideas of others" (Namely PARC, and the Xerox
Star) decided that for some reason that since they had effectively
stolen it that they should sue whoever else tried to come up with a
GUI. This pretty much convinced Digital Research not to pursue the
project any longer.

Fine. If you want it use it. I can generate any three dimensional,
textured object I want, when I need it for what I am working on. I
reiterate, however, that real-time 3D is a waste. Period. Not too

complicated. Not too expensive. Just a waste of processor cycles.

>
>Sure, using your Atari, you can access a small subset of the content available

That's fine Brian. But where does it go from there? How many months before you find you can't run the newer applications until you feed more money into your machine? Karen and I use our TT online constantly for research. It does what we need. Why do I need to have shockwave? So I can put a little magnetic beard on a cartoon face? Java to play a tic-tac-toe game? RealVideo so I can watch a jerky picture that I've already seen on television in most cases? RealAudio in case I stumble across someones softcore site? And so on. Most of those are worth maybe 10 seconds of my time. Why go for virtual reality when I've got reality right outside my door - and an unlimited imagination? We've been to a total of about 6 places where we really needed to be but couldn't go due to the 'limitations' of our TT. Did we rush out and Spend >$1,000 on a PC or Mac? Sorry, we just ambled on over to the local internet cafe and visited them for $1.50. In my interpretation, that is not a "small subset" - and everything you mention is applicable to the web. You really shouldn't imply that it applies to all of the internet.

Only a technically challenged company like Microsoft would think of implementing a consumer operating system with 8.3, no case-sensitivity and no case-preserving file names. And only a stupid company like Atari would copy them.

> Yup, Apple was being real innovative there. As long as you consider
> stealing Xerox Palo Alto Research Centers Ideas part and parcel and

Apple bought the Xerox technology in exchange for stock. The then proceeded to define most of the user interface elements that are still in use today: menu bars, check boxes, radio buttons, etc. They were annoyed when Microsoft tried to use those same elements in Windows. Of course, they didn't worry about Atari because they knew that Atari wasn't good enough at copying for it to be a problem.

We all feel sorry for Atari users. It wouldn't be fair if we excluded them just because they picked a crappy computer system.

Some of use aren't totally focused on games. We use 3D software, such as SoftImage, to get real work done. I just thought that explaining that would make it too difficult for the average Atari user to understand.

found this on comp.sys.mac.advocacy.....
This was just too great to not share.

Enjoy

http://dailynews.yahoo.com/headlines/technology/zdnet/story.html?s=n/zdnn/technology/19980821/19980821506

The Top 10 Surprises About Apple's New iMac Computer

10. Free "Gullible Consumer" button with every purchase.

9. It only costs twice as much as a 233 MHz Pentium II, yet it will run almost 29% as much software!

8. Includes "Robert Downey, Jr. Mode" for energy-saving auto shut-off.

7. Decided not to go with the original "Bill Gates gave us a ton of dough and here's what we came up with" marketing campaign.

6. Special "Presidential" version: the iMacDaddy.

5. Still "insanely great," but now with 300% more insane!

4. Makes a Grande Skinny Latte like nobody's business.

3. Trash can icon lined with Apple stock certificate icons.

2. Due to miscommunication with design team, the first prototype was called the IMAX and featured a 100-foot high monitor.

And Top5's Number 1 Surprise About Apple's New iMac Computer...

1. Design team responsible for "new look" signed the inside of the case -- in Braille.

A program interuption to bring this note to Daniel's attention about previous notions of lack of Apple retailers..

Apple Canada Announces Hartco's Renewed Commitment to Sell Apple Products

Compucentre, MicroAge, CompuSmarts, and CompuSmart Networks to Showcase New iMac

MARKHAM, Ontario -- August 13, 1998 Apple Canada and Hartco Enterprises today announced that Apple's exciting new iMac product will be launched in its networks of computer resellers across Canada. Hartco is the master franchisor for 54 Compucentre stores, 75 MicroAge branches, and 14 CompuSmart stores located across Canada.

"Hartco's national presence enables Apple to substantially increase the retail exposure for the iMac in Canada and provide our customers with an opportunity to "test drive" and purchase an iMac when it becomes available on August 15, 1998" said Wendy Hayes, Vice President , sales, Apple Canada.

Compucentre, MicroAge, and CompuSmart will aggressively promote the iMac in all retail locations and will prominently feature the iMac with in-store displays and demonstrations. The locations will also offer a range of Universal Serial Bus (USB) peripheral products that support the iMac. The iMac uses USB to communicate with add-on devices such as writable disk drives, printers, scanners, cameras and game controllers.

"We're delighted to strengthen our partnership with Apple to deliver the iMac to customers through our national retail chain," said Jeffrey Hart, Executive Vice President of Hartco. "Based on consumer reaction to-date, we believe the iMac will be a phenomenally successful product and anticipate strong consumer demand for the product."

A complete internet-age computer right out of the box, Apple's iMac combines the excitement of the internet with the simplicity of the Macintosh. The iMac features:

A speedy PowerPC G3 microprocessor running at 233MHz with a high speed 512k backside L2 memory cache; Built-in 15-inch high quality display with 1024x768 resolution, 13.8-inch diagonal viewable image size; Easy connectivity - one button Internet access, internal 56Kbps modem, 10/100Base-Tx Ethernet, 12Mbps Universal Serial Bus (USB), and 4Mbps infrared port (IrDA); The world's easiest to use operating system, Mac OS 8.1, which runs thousands of Macintosh software titles; All housed in a stunning translucent enclosure that breaks new ground in industrial design.

iMac, which will ship with a 56K modem, will also come bundled with a variety of consumer software, including: AppleWorks (formerly ClarisWorks) productivity software; FaxSTF from STF Technologies, Inc.; Quicken Deluxe'98 from Intuit, Inc.; MetaCreation Corp's Kai's Photo Soap; MDK from Interplay Productions; Pangea Software's Nanosaur; Williams-Sonoma Guide to Good Cooking from Broderbund Software, Inc.; Microsoft Corp's Internet Explorer 4.01; Microsoft Outlook Express 4.01; and Earthlink, Inc's Total Access 2.01.

Hartco Enterprises Inc. is Canada's largest franchisor of computer integrators and retailers with 164 locations strategically located across the country, serving the business, government, professional and home markets. They operate under the names of "MicroAge", "Compucentre", "Northwest Digital" and "CompuSmart". In addition, the company owns and operates 61 department stores under the "Hart" and "Bargain Giant" banners in Quebec, Ontario and the Maritimes. Hartco also operates 22 "La Cabine Telephonique" and "The Telephone Booth" outlets in Quebec and Ontario. Company shares trade under the symbol "HTC" on the Toronto and Montreal Exchanges.

Apple Computer, Inc. ignited the personal computer revolution in the 1970s with the Apple II, and reinvented the
personal computer in the 1980s with the Macintosh. Apple is now recommitted to its original mission - to bring the
best personal computing products and support to students, educators, designers, scientists, engineers,
businesspersons and consumers in over 140 countries around the world.

Apple Canada Inc. is headquartered in Markham, Ontario and is a wholly-owned subsidiary of Apple Computer, Inc. Apple products are available at more than 300 Authorized Apple Canada Dealer locations across Canada.

So you paid valuable money to buy an emulator to run DOS software more slowly
than on a PC? That is impressive.

> That would be a driver issue, actually... an
> entirely separate matter. At least we could
> attach them.

If you can't get drivers for printer because you bought your computer from a
backwater company then you should consider buying a different computer.

> Macs used to sell for more than new cars.

True enough. Ataris were as cheap as dirt and about as useful as dirt when
performing computing tasks.

> So? How much does your T1 cost you?

I don't have a T1 at home. A lot of those technologies are pretty easy on your
bandwidth.

You had access to a PC or Mac and didn't just use it?! I'm not sure that we
have any basis for meaningful communication :-)

> Sorry, that doesn't wash. All Apple did was restrict people with
> their file system and set themselves up for a niche market.

Yeah. Forcing 8.3 file names, not allowing spaces and not preserving case was
not restricting. Apple inovated to more the industry forward. Atari copied to
hold it back. If Atari really thought that the DOS filesystem was a good idea
then they should have made clones.

> The GUI overlay, GEM showed great
> promise, and worked across platforms, until Apple, who had done "a

> GUI. This pretty much convinced Digital Research not to pursue the
> project any longer.

Repeat after me "a good job of BUYING the ideas of others." They then went on
to develop most of the UI elements that are still used in the industry today:
such as the menu bar, radio buttons, check boxes, etc. Atari, OTOH, didn't
come up with any good ideas and stole the worse of other people's ideas.

> Fine. If you want it use it. I can generate any three dimensional,
> textured object I want, when I need it for what I am working on. I
> reiterate, however, that real-time 3D is a waste. Period. Not too
> complicated. Not too expensive. Just a waste of processor cycles.

Wrong, wrong, wrong and wrong. How do you preview and edit your
scenes/animations before you do your final render? Do you see them in wire
frame? In the world of fast computers, OTOH, you can preview your renderings
in realtime with lighting effects and transparency. Even a $100 graphics card

can gauraud shade and render a million polygons/s.

> That's fine Brian. But where does it go from there? How many months
> before you find you can't run the newer applications until you feed
> more money into your machine?

It totally depends on my need to run those applications. If I need to then I would probably buy a new computer. With the Atari, OTOH, you know that you will never get any processor intensive applications because they don't have much of a processor to begin with.

No, what does real audio or real video have to do with the Web? The web is just a convenient way of accessing the files.

Kind of makes you wish you could travel back in time to read Ford's
press releases about the Edsel.

>Now back to the scheduled programming of flamming. Keep it up Brian,
>Terry(wife too), Jedi and of course you 'chunks'

Just for clarification, any comments that appear in c.s.a.advocacy are
strictly my own. My wife enjoys our STs and TT and also has many
years experience with other operating systems. But she doesn't post
to this newsgroup, which is why I always sign.

I personally don't see it as flaming. Civilized observations from
various opposing viewpoints. If you want to see some flaming, check
out some of my posts in the more politically-oriented newsgroups :).

I like Apple. I wish them all the luck in the world. But that
doesn't stop me from pointing out perceived problems and fallacies or
inconsistencies in other peoples posts. I do the same thing with
Atari posts.

One button internet access huh? Gee, I'm sooooo confused. Here we
have this group that has their real-time 3D.... something that has
been claimed to be too complicated for Atari users.... yet they can't
figure out how to log onto the internet by themselves. Just another
example of our buddies over there deciding for themselves where you
want to go today

2410. Re: Extra Extra Extra...Mac fanboys buying up iMacs!

Newsgroup: comp.sys.atari.advocacy
Date: 1998-08-23 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <35e07a59.0@diana.idirect.com>
Source record: 4671

now HERE's an interesting bit of news - more interesting than the mindless posting of Apple press releases TIFKAS (The Idiot Forever Known As Sinclap) hides behind.....

in a REUTERS news article, a poll was taken by Computerware, a company carrying the "revolutionary" iMac. In it, 500 customers who had bought the new Apple wondertoy were asked regarding their computing background.

Of them, 15% (75 buyers) said that they were first time users buying their first computer.

13% (65 buyers) said that they were switching over from Windows to the iMac.

This leaves a whopping 72% (360)of these iMac buyers as existing Mac users. Gee, with numbers this impressive, Apple should be increasing their market share in no time :) However, there are a limited number of fanboys, so what'll happen when they all buy them.

Wanna check these figures for yourself? Check out the article at http://www.cnn.com in their Sci-Tech section - and also read about how iMac users are having difficulty connecting to the web...

TIFKAS is obviously clutching at straws to the point that rather than face the issues he directs insults at people about their supposed physical appearance. For the record, I'm 5' 8" and 200 lbs, and I unload trucks as part of my job description, so a good part of that weight is solid muscle; I also regularly cycle 20 miles round trip to work. And I can diet. For TIFKAS, however, getting the fat out of his head is a more delicate matter (I guess the liposuction backfired)....

>
HAHAHAHAHAHAHAHAHAHAHAHAHAHAHA!

Is that the best that Apple can do, TIFKAS - getting the iMac into COMPUCENTRE?

For the record, Compucentre is perhaps the most CLUELESS computer store chain in Canada. Tons of outdated software, unattentive staff and poorly maintained stores. And computers just sitting there unattended. Even when they used to carry Apple, their promotion of it as well as their knowledge of the product was woefully inadequate. And the number of stores have been shrinking over the last five years.

To REALLY sell the iMac, Apple should be targeting the shops like FutureShop, The Brick, Adventure Electronics, Bad Boy. However, what with Apple's treatment/disdain of their dealers (FS and Adventure used to carry Apple), these companies wouldn't touch the iMac with a snail fork.

Gee, 132 stores to sell an overhyped, overpriced, underfeatured appliance in a sovereign country of at least 40 million people. Is that the best Apple can do?

>
>Peter S.
>
>"The iMac has been the biggest computer launch we've seen in
>our history. Apple is back, and iMacs are flying off CompUSA store shelves

>James Halpin, president and chief executive officer of CompUSA

too bad 72% of those sales have been going to existing Mac users
(see http://www.cnn.com in their sci-tech section for a report from
REUTERS on this - a more reliable source than TIFKAS, whose own
demeanor suggests someone whose mommy still has to cut his meat for him).
Too bad too that Apple has been pretty tight-lipped about how many
iMacs they've actually sold rather than shipped pre-ordered......

I notice, significantly, that the major thrust of the section was
conveniently ignored. However, what's your point? That everyone
should have broken into little clusters where no one could communicate
with anyone else? That's absolute idiocy. I can pick up radio
signals today with a seventy year old radio. Does that mean that
technology hasn't advanced? And as far as being a great innovator by
using long file names - sorry to disillusion you, but I was using long
file names on my Convergent Technologies C3 system and Wang word
processor long before the thought of the Lisa had even occurred to Woz
or Jobs.
[snipped]

Stolen. You buy the ideas of others and then try to convince the
world that they were yours, it's theft. As far as menu bars, radio
buttons, check boxes etc. go you are just (I have no idea whether it

is consciously or you just really don't know) perpetuating another
Apple fostered myth designed to delude the gullible, uninformed or
uninterested. All of these features were available on government,
university and industrial CAD/CAM programs as long ago as the early
seventies. The fact that they were only available on an application
by application basis and that Apple stole the ideas for use
system-wide does not make it any less of a theft. Perhaps you don't
like hearing the words stolen or theft - guess what? I don't like
hearing the word innovative for ideas that Apple did not originate.

Yes, and don't the bean counters love it when you do. I'll ignore the
comment about the Atari since I happen to know what my machine is
capable of and you're guessing.

Actually, you have absolutely no idea of how limited or complex my/our
needs are. You also have no real sense of what is out there since you
seem to be concentrating on the bandwidth-wasting doodads. I have
access to any computer I want. My TT does 99.7% - what could be
simpler than that?

Right. So what's your point? Stop on over to a local Atari users
house and let them show you how they can access all of these files
that you seem to think are outside the domain of Ataridom. Until you
do though, you should tread a little more gently with all-encompassing
statements. They will eventually make you seem quite uninformed, as
opposed to your current status as an honorable Mac/PC proponent with a
differing view of Ataris.

It wasn't the present that was under discussion.

However, it was nice how your conveniently deleted that
rather trivial bit of my post (in terms of size) that
referenced the cost of Apple computers for the point in
time the comparision was being made.

It's so nice of Apple to FINALLY release computers 'kinda'
accessable to the bulk of consumers now that the PC cloners
have already done it and catapulted Billy into his position
of dominance while doing it...

--
Hardly. Microsoft has brought the microcomputer OS to
the point where it is more bloated than even OSes from |||
what was previously larger classes of machines altogether. / | \
This is perhaps Bill's single greatest accomplishment.

My bandwidth is half of a T1. Mind you, I'm somewhat atypical
and I realize that. I was playing with digitized audio & video
10 years ago so clogging up one's network pipe with it doesn't
quite impress me as you might expect.

>original Macs, OTOH, were nicely desiged little units.

Isn't that personality, then?
How would an ST be a regular PC, when it doesn't match it either hardware-
software or case-wise?

>And then there was TOS. It was the worst of all operating systems. It wasn't
>compatible with anything, used the stupid DOS filesystem and the GUI was so
>disgusting that you felt like using CP/M.

The MacOS wasn't compatible with anything. GEM was at least compatible with
FAT (Although I don't count that as a good point).
The Mac GUI wasn't any better-looking at the time, either.

>Of course, things have changed. Atari's are now using processors that are
>slightly better than those in our watches and the operating system is almost

>the past of computing instead of being caught up in silly crazes like 3D and
>the Internet.

The InterNet has not bypassed the Atari users. Many users post to the csa
newsgroups using NEWSie or other newsreaders.
The processors of watches are pathetic in comparison to even the slowest of
all Atari processors. The 68060 is not a bad processor at all, and can handle
both 3D graphics and InterNet.
Besides, an OS that is half as good as BeOS or OpenStep, is far better than
the MacOS.

The DOS UI was non-existant at the time. Who in the world would want to run
DOS?
Just like Apple brought the GUI from the lofty heights of Xerox and the STAR,
Atari brought the GUI to average people, even poor people, students and
schoolchildren. I suppose you think that computing is only for the rich
dandies who can afford expensive furniture such as the trendy Apple.

>> oh, silly me, I must be hallucinating that I'm posting this on the

3D games have been available for the Atari since it was first released. Most flight sims were in 3D, along with Elite II and a host of others. How about 3D Construction Set or Persistance of Vision?

DHTML, Javascript and Java are all unnecessary, untested features for idiots to try out on their web pages, along with the <BLINK> tags and MIDI background melodies. I do hope for CSS support soon, though.

hi Ron,

actually, Brian's pretty good, and he does give good argument. In
fact, he started all this admittedly tongue in cheek a few posts ago.
I'm sure that like all good debaters, he has at least some real respect
for rational Atari users, like I have for rational Mac users. I've
conceded to him on some points in the past, and even he's admitted
some of my points have merit.

Besides, any Mac user who agrees with me that Sinclap is a
disturbed little punk who really needs a life is ace in my book :)

BTW, Brian, I missed your original reply to me from a few days ago
- for some reason, Idirect only keeps the contents of c.s.a.a for a
day, and I missed logging on the day you replied. I'd like a chance to
reply to your arguments direct :)

I'll add my vote to that. As much as I've been going back and forth
with Brian, I understand perfectly what he is trying to say and both
enjoy & respect his comments. Besides, I like the Mac. Can't abide
universal cover-everything observations, that's all :)

> Besides, any Mac user who agrees with me that Sinclap is a

so now, defending pornography. I may have my disapreement with feminists,
but I don't refer to them as "whiners". Maybe TIFKAS, despite his claims to be
a "macho stud", is really afraid of women.

>> And no wonder you want to vote for Bill Clinton - you're now BOTH

>Clinton is directly elected and can't be bounced except for treason.

hmmm, I remember in my history books that Andrew Johnson was targetted for
impeachment because some senators didn't like the fact that he didn't want to
harshly punish the South as they wanted. And IIRC, wasn't the argument for
Nixon being impeached involved his lying, covering up, destroying evidence, and
conspiracy to commit a felony. Neither one involved a charge of treason. But
then again, that's what I expect of a Nixonian idiot despite your sheepskin....

I am
>disapointed that its gone this far that could of been settled last January.
>Its come down to this that the special prosecutor found no wrong doing in
>WhiteWater but wants to nail him for dropping his pants for pleasure after

I believe that conspiracy to mislead a grand jury is also a felony, is it
not? That's probably the whole focus of Ken Starr's current investigation -
whether he instructed or cajoled Monica about lying about their relationship.

>Don't tou wish to be a macho stud, chunks?

nope. You can have your bimbos - I'm looking for a real woman with a brain,
like Bonnie Raitt.

BTW, I hope you're at least using protection - wouldn't want to see you die
in five years from some of those terrible diseases going around :)

The only "chunks" you should be concerned about are the ones you blow all
over this forum.....

>Your're complaining.. A great indicator that the imac is drawing new users..

nope, just the facts, m'am (a concept you are foreign to). Since when are
existing Mac owners "new users"? In order to increase the market share, Apple
has to sell to other than "new users". And since there are a finite number of
Mac fanboys, expect to see those numbers of initial sales to go down - WAYYYY
down - as time goes on. You really are Dr. Spin, TIFKAS - maybe you should be
Bill Clinton's speech writer :)

>
>> Wanna check these figures for yourself? Check out the article at

then why didn't you report this supposed "good news" to
comp.sys.atari.advocacy THE DAY IT WAS PUBLISHED, weinerhead - or were you
trying to concoct another one of your dismissive disinformation campaigns
which consist of mindlesly parrotting Apple press releases? BTW, I'd like to
hear your take on the problems people are having getting their iMacs onto ISPs
that was reported in the same article - or are you going to conveniently ignore
that?

>

>
>Pot Kettle Black..So you're a laborer?

ah, another lame TIFKAS insult. Since when has it been a shame to be a
labourer? They happen to be the backbone of any consumer-driven economy, and
are responsible for buying many consumer goods - including computers. Which
means they help provide your wages, pinhead. And I would love to see what would
happen if you tried using that elitist attitude on a steel worker to his face
rather than hiding behind a computer screen. (Me, I would just laugh in it).

Fact is, unloading trucks is part of the job description. I'm involved in
sales and service in the hardware industry, which includes mixing paint,
pricing, restocking, graphics design, advising customers, key making, and
handling customer relations. I'm also responsible for the electrical, tool and
automotive sections. What I make allows me to live very comfortably (I've
always been frugal) - I've bought a nice new cruiser bike to get around town
on, I bought a nice used laptop (Apple, it's a nice little computer), and I'm
going to the CNE today and spend my brains out :)

Face it, TIFKAS - your little screeds are as pathetic as Eric Cartman's
infamous "beefcake" speech. Let's hope your mom bought you lots of Cheezy Poofs
to snack on....

Real time conferences huh? Sure they're nice parlour tricks
but there's still too much snap crackle and pop. If you really
need to get some serious realtime communications done one is
still pretty much better off using tools that were available
10 years ago.

[deletia]

->then again, that's what I expect of a Nixonian idiot despite your sheepskin....

I do believe Daniel is right. Andrew Johnson took over the presidency when
Abraham Lincoln was assasinated, and wished to continue Lincolns' policy
of leniency towards the South. Of course, members of Congress disagreed,
and wanted to make it just as hard on the South as possible. It did actually
come to a vote on the impeachment issue, and failed by only 1 vote. It was
that close. AFAIK, Johnson was the only President to have impeachment
proceedings actually go to a vote...

History 101 is now recessed... ;-)

> I believe that conspiracy to mislead a grand jury is also a felony, is it
>not? That's probably the whole focus of Ken Starr's current investigation -
>whether he instructed or cajoled Monica about lying about their relationship.

Whatever people may see in the current situation the fact remains that
the statute empowers the special prosecutor to look into a specific
alleged criminal activity. Mr. Starr still calls his investigation
the "Whitewater investigation". Without the backing of a congress
controlled by the opposing party there is no way that this
investigation legally should have left the confines of a failed
twenty-year-old business deal. No Travelgate (how ridiculous, all
administrations bring in their own people). No Filegate (the Chief
Executive by definition has access to records of an agencies within
the Executive branch, especially when they're stored in the White House).
No investigation of the death of Vince Foster. No aiding in the Paula
Jones case (Mr. Starr was one of the first lawyers to volunteer, and
afterward provided all of his advice for free). And no investigating
whether or not Monica Lewinski gave President Clinton a hand or blow job.
Whether or not Mr. Clinton was wrong in what he did, it should have never

seen the light of day in this venue.

Some little known facts are that:
- If Mr. Bush had remained president, Mr. Starr was to be recommended for a Supreme Court appointment.

- Mr. Starr is and always has been a tobacco company lawyer and what better way to blunt the thrust of a percieved anti-tobacco president (and yes, I am a smoker).

- Mr. Starr, within three days of being appointed Special Prosecutor indulged himself in a little conflict-of-interest. His Kirkland & Ellis law firm, from which he did not severe ties was being sued by the RTC (Resolution Trust Corporation) for its connection to a failed bank. Within three days of being appointed, Starr started using his unparalleled powers as a special prosectutor to begin investigating the activities of the same RTC officials who were involved in the decision to sue his law firm. Starr's law firm settled out of court in January of 1996 for $325,000 -- $700,000 less than the RTC had predicted it could have gotten in a trial. Starr said that he did not know about the case -- which the RTC filed in May of 1993 -- until October 1995, even though he served on the firm's management committee (yeah, his secretary forgot to tell him that there was a one million dollar lawsuit against his company). This from the same man that threatened imprisonment to people because they could not remember details from a single afternoon twenty years in the past.

- Mr. Starr, who claims he is only pursuing the matter to determine whether there was perjury or evidence of suborning perjury has already been found guilty of both. It has been proven that he not only deliberately leaked information about his investigation (which in itself is a crime, and the first time in the 23-year history of IC's that one has even been accused. Mr. Starr not only lied to the court about having done so, it was determined that he had instructed his attorneys and investigators to lie about it also.

- Robert Fiske, the earlier Whitewater investigator was removed because Republicans claimed that he had a conflict of interest , in that his law firm (no him individually) -- from whom he had taken a leave of absence -- had represented International Paper in the past. When he was appointed as Whitewater Independent Counsel, Kenneth Starr _himself_ represented International Paper, which had sold land to Whitewater Development Company. As stated earlier, Mr. Starr maintained his ties with Kirkland & Ellis.

* The point of all this is not to revile Kenneth Starr. It is to show that he was a man with an agenda. An agenda that could hardly be termed "Independent." An agenda that neatly meshed with the interests of others who were able to ensure that he could continue

his investigation in any direction that he wanted. Anyone that didn't mesh as with with the motivation of particular political interests would have been canned within two weeks of anyone uncovering this information. The media new about it, but sensationalism sells. Most people did even hear about it. And when your raised on soap operas where people are murdering their mothers and raping their neighbors dogs, they want to hear the sensationalism.

Some things I don't like:

- Kenneth Starr earned over one million dollars from his private practice in 1995, while he was supposed to be dedicating himself with investigating Mr. Clinton.

- More than eighty million US dollars has been spent on investigating Whitewater over more than six years. In fact, the FBI provided more resources to this investigation than to the World Trade Center bombing. When you spend this type of money, and use these unlimited resources, do you really think that it's strange that they eventually found *something*????? What you should really find strange is that the only wrongdoing that the president has been found to have engaged in was getting a little on the side. I agree that that is wrong, but I do not agree that it is criminal.... worth >eighty million dollars.... or worth six years of devisiveness and making the United States appear to be a laughingstock to a large portion of the world.

I am not saying that your belief that he is "a turkey and should do the right thing and resign" is wrong. It's your opinion and is just as valid as mine. But I agree with him that this was politically motivated and it was none of their business. I don't ask the grocery clerk if they are an adulterer and if I find that they are put my groceries back and shop elsewhere. And I certainly wouldn't ask the fireman that came to my flaming house whether they committed adultery and if they have tell them to just go on back to the station.

OK, I've vented in an entirely inappropriate area. I apologise and promise that I won't continue this, period.

I'm wasn't trying to say that Apple invented long file names. UNIX has had 256
character file names since man crawled out of the ooze. There are times when
you face a choice between compatibility and superiority. Apple choose
superiority and I am happy with that choice.

There are two ways that you can run an engineering company: the bean counters can tell the engineers what they are allowed to have to do their jobs or the engineers can tell the bean counters what they need to do their jobs and the bean counters can work their buts off trying to get it for you. The later is a far better model and, fortunately, how it works at our office. But Atari users can't get good jobs so they will never know :-)

> So is plain HTML 2.0

It depends on what you need out of the presentation. Plain text might be good more some presentations, HTML for others and Shockware for still others. Limiting your access to technologies is, well, limiting.

> So is plain HTML 2.0

Java is very handy for navigation. Don't you like menubars? A lot of sites allow you to use a Java menu system for navigation.

> Why, am I illiterate? Can I not read? Why waste the bandwidth?

I find it hard to read while I'm going something else (but Atari users, I've heard, have eye stalks so they don't have this problem) but I can listen to a conference presentation while still working.

Here's the question of they day: how many lines and gauraud-shaded polygons can it render in a second? I spend most of my time writing SV software so those attributes are pretty important to me.

True, but what's your point? Apple didn't make any design compromises for compatibility. Atari made a big compromise for very limited compatibility.

> They run Apple system software well enough.

You must have meant "ran" here. Yeah, the Mac Sac was great. It cost be $300 and half the programs that I wanted to run didn't work.

<Blush> Actually, I don't use my Mac very much anymore. PC development pays better these days and my PII-400 is much faster than my Mac (or any Mac). I am still writing freeware stuff for the Mac and hopefully I'll get back into the Mac scene when Apple starts making some good products again. Not that I am very hopeful. There is an on-going discussion in comp.sys.next.advocacy about how Apple is ruining OpenStep (my favorite operating system) to make it run Mac OS applications better. They also got rid of the shell and command line. Atari doesn't have the market in corporate stupidity cornered. As I said before, I haven't used a modern Atari enough to respect or disrespect their use. I bought a Mac Plus because I was having problems getting software for my ST. I probably used it for 2 years after that to play Barbarian and SubBattle (the Mac version sucked).

> Besides, any Mac user who agrees with me that Sinclap is a

I remember two harrier sims for the ST. One was wire-frame and so bad that
the programmers probably comitted suicide after it was released. The other
one was almost as bad and not fully 3D. In any case, I was refering to
professional 3D work, not games. Atari computers have always been, and will
always be, too slow for this.

> DHTML, Javascript and Java are all unnecessary, untested features for idiots

DHTML, Javascript and Java are very useful. They can all save bandwidth if
used correctly. They can also enhance the user-experience of your site. But,
of course, if you don't have it then you have to say that you don't want it
:-)

BTW, this thread is getting too serious and I've gotten a few insulting e-
mails. Maybe we should drop it.

Many? The vast majority of people don't do much more than
we all were doing with 8Mhz 68000s 10 years ago. There's
a bit of the bigger and better but not much has really
changed. That's likely the reason for the rise of GNUware.
People eventually got tired of continually paying again
and again for what was esentially the same thing for over
a decade.

The long filenames were never the problem. GCR was.
They could have come up with vfat 10 years ago if
they really wanted to be crafty. Instead they created
a little ghetto for their users.

You forgot the more realistic model. Real engineers consider
real concerns and constraints. One of those is cost. Another
is interoperability. They also consider the specific task at
hand.

The ST ran any Application that it would make sense enough
to run under CPU emulation quite well enough actually. Also,
universal storage is far from limited.

>

Spectre GCR actually and it ran rather better that you
give it credit for. There really wasnt much to emulate
in an old mac anyways. Hell, the PC's of the day had more
in the way of support processors.

Actually, I'm a linux user. I can do the streaming
video thing as well as the streaming audio thing.
They just don't impress me as I would rather not
deal with communication glitches while playing my
media. My expectations are higher due to previous
experience and I'm not taken in by some minor glitz.

I can use as much in terms of resources to use a
given task as I want to and am not required to
keep up with a pointless technology race just
to deal with the stupidity in Cupertino or Redmond.

So? Most 'modern' Macs and PC's are too. Non-Amigas only caught
up with Amigas in this respect just a few years ago. Previous
to that it was either a toaster or an SGI.

What was available for the ST was comparable to the rest of
the sub-MiniComputer software available at the time.

They crash Windows/Mac browsers far to frequently to be
taken seriously.

2442. Does Peter Sinclair have a life?

Newsgroup: comp.sys.atari.advocacy
Date: 1998-08-25 00:00:00 UTC
From: richardhutnik@hotmail.com
Message-ID: <6rt4skdla1@nnrp1.dejanews.com>
Source record: 4689
Cross-posted to: comp.sys.atari.advocacy,rec.games.video.atari

Do a search on his profile in Dejanews. The predominate posts by him involve harrassing fans of the company once known as Atari, and its products. He uses his Mac tyrades to try to one up people or something.

I am curious... anyone know if he actually has a life? I am surprised anyone would continue, at this time, to bash the Jaguar, which is no longer on shelves, but Peter Sinclair insists on this.

Now, do I have a life. That IS a good question. I am on Dejanews, decided to see if there was anymore Battlesphere news in the Atari newsgroup, and I find Peter still flaming away.

To think the whole Battlecruiser 3000AD flamewars on the comp.sys.ibm.pc.games.strategic newsgroup have stopped before Peter has. What a concept!

- Richard Hutnik

The PC, it may be slow, it may be kludgy, but I can get one made off the shelf the way I like it, and at least I can get a good amount of software. Also, it allows me to have a system without it becoming a religion, unlike what the Mac has done to Peter Sinclair.

>whether he instructed or cajoled Monica about lying about their relationship.

Whatever people may see in the current situation the fact remains that
the statute empowers the special prosecutor to look into a specific
allegedly criminal activity. Mr. Starr still calls his investigation
the "Whitewater investigation". Without the backing of a congress
controlled by the opposing party there is no way that this
investigation leagally should have left the confines of a failed
twenty-year-old business deal. No Travelgate (how ridiculous, all
administrations bring in their own people). No Filegate (Chief
Executive by definition has access to records of an Executive branch,
especially when they're stored in the White House). The death of
Vince Foster. Aiding in the Paula Jones case (one of the first
lawyers to volunteer, and afterward provided all of his advice for
free). And investigating whether or not Monica Lewinski gave
President Clinton a hand or blow job. Whether or not Mr. Clinton was
wrong in what he did, it should have never seen the light of day in
```

this venue.

Some little known facts are that:
- If Mr. Bush had remained president, Mr. Starr was to be recommended for a Supreme Court position.

- Mr. Starr is and always has been a tobacco company lawyer and what better way to brunt the thrust of a percieved anti-tobacco president (and yes, I am a smoker).

- Mr. Starr, within three days of being appointed Special Prosecutor indulged himself in a little conflict-of-interest. His Kirkland & Ellis law firm, from which he did not severe ties was being sued by the RTC (Resolution Trust Corporation) for its connection to a failed bank. Within three days of being appointed, Starr started using his unparalleled powers as a special prosectutor to begin investigating the activities of the same RTC officials who were involved in the decision to sue his law firm. Starr's law firm settled out of court in January of 1996 for $325,000 -- $700,000 less than the RTC had predicted it could have gotten in a trial. Starr said that he did not know about the case -- which the RTC filed in May of 1993 -- until October 1995, even though he served on the firm's management committee (yeah, his secretary forgot to tell him that there was a one million dollar lawsuit against his company).

- Mr. Starr, who claims he is only pursuing the matter to determine whether there was perjury or evidence of suborning perjury has already been found guilty of both. It has been proven that he not only deliberately leaked information about his investigation, and then not only lied to the court about it, he instructed his attorneys and investigators to lie about it also.

- Robert Fiske, the earlier Whitewater investigator was removed Republicans claimed that he had a conflict of interest because his law firm -- from whom he had taken a leave of absence -- had represented International Paper. When he as appointed Whitewater Independent Counsel, Kenneth Starr _represented_ International Paper, which had sold land to Whitewater Development Company. As stated earlier, Mr. Starr maintained his ties with Kirkland & Ellis.

Some things I don't like:

- Kenneth Starr earned over one million dollars from his private practice in 1995, while he was supposed to be dedicating himself with investigating Mr. Clinton.

- More than eighty million US dollars has been spent on investigating Whitewater over more than six years. In fact, the FBI provided more resources to this investigation than to the World Trade Center bombing. When you spend this type of money, and use these unlimited resources, do you really think that it's

strange that they eventually found *something*????? What you should really find strange that that the only wrongdoing that the president has been found to have engaged in was getting a little on the side.

I am not saying that your belief that he is "a turkey and should do the right thing and resign" is wrong. It's your opinion and just as valid as mine. But I agree with him that this was politically motivated and it was none of their business. I don't ask the grocery clerk if they are an adulterer and if I find that they are put my groceries back and shop elsewhere. And I certainly wouldn't ask the fireman that came to my flaming house whether they committed adultery and if they have tell them to just go on back to the station.

OK, I've vented in an entirely inappropriate area. I apologise and promise that I won't continue this, period.

so, TIFKAS (the Idiot Forever Known As Sinclap) DOES inhabit other forums other than the atari forums? Interesting. It's also interesting that he actually rarely posts to the mac newsgroups - last I saw him there he was harassing someone who dared point out the flaws in the iMac with a sketch about a middle-aged couple seeing the flaws and going to see the PCs; TIFKAS sneered that "who would name anybody Martha - let all the Marthas own Packard Bells!" (this can ALSO be found on DejaNews, TIFKAS, so don't try to rewrite history again)
>
>I am curious... anyone know if he actually has a life? I am surprised anyone

he CLAIMS to have a life - lots of money, flashy car, he's breeding like a bunny. Unfortunately, he uses this song-and-dance every time he wishes to dodge the issues - that and making snide, elitist remarks to anyone who dares to contradict him. My take is that he's no better off a working stiff than any of us, and is in constant fear of losing his job. His utter idiocy (to the point that he makes up facts about Ataris, like claiming that "90% of all TOS applications fall over on the Milan", and "for the cost of a Nemesis board you can buy a UMAX Mac clone <NOT a typo>", and "Ataris have inadequate Internet clients" - not to mention claiming that Canada is the 51st State) certainly doesn't help.

The Amiga made the Mac and Atari appear second-rate.
The Mac had a shit OS, and the Atari's capabilties were too limited.

The Amiga was simply the best home system available until 1994, no doubt
about it.
It too was a lot cheaper then the Mac, and far more capable.
Mac OS still sucks in comparison to Amiga OS.

I forgot, to much work on my mind like planning for the reopening of the new
Comp store in Arlington, whether I will have enough Mac inventory on hand
etc..

As for ISP issues. Apple has isolated the login issues. Their answer is:
subscribe to earthlink. The cause is that many ISP's have not fully upgraded
to the 56k V.90 standard.

I just asked you a question. Again you have a reading comprehensive defect.
I was a laborer at one time in College. My job description included trouble
shoot all these wintel computers in the library and special assistant to the
Library Director which involved in delivering papers and cooerespondence to
other dept across campus. At least I had plenty of outdoor adventures with
lots of physical exercise. During the time when the library was going through
rennovations from top to bottom that included the addition of the fourth
floor, wiring network nodes was a bitch but we got it done.

Yea soo. Apple lost more than that and they are back. CompUSA will be a $10
billion retailer by 2000.

Peter S.

Creative Computers' MacMall Reports Record $4 Million in iMac Orders; Demand From PC Owners Drives Expanded Exposure for iMac 08:05 a.m. Aug 24, 1998 Eastern

TORRANCE, Calif.--(BUSINESS WIRE)-- Aug. 24, 1998--Creative Computers, Inc. ("Creative") (Nasdaq: MALL) today announced that its MacMall division, a major cataloger and Internet provider of Mac products, reported a record $4 million in orders of Apple Computer Inc.'s ("Apple")(Nasdaq: AAPL) iMac as the company continues to take orders into the second week of the product launch. The sales represent the Company's largest ever dollar volume for a computer at launch.

Additionally, the Company reports that it has received so much interest in iMac from its PC customers that it will expand its exposure for iMac by advertising it in its PC Mall and ComputAbility catalogs.

"We expected it to be big, but
consumer interest in iMac is bigger than big,"
said Dan DeVries, executive vice
president of Sales and Marketing of Creative,
which owns and operates MacMall.
"Our CEO, Frank Khulusi, and I are both
so excited about iMac that we each
bought one for our families."

"Orders for drives, USB scanners,
printers, connection devices and software
have also been fantastic," added
DeVries. MacMall offers a complete selection
of iMac peripherals.

"We're shipping iMac every day in response to the incredible consumer demand for our newest computer," said Mitch Mandich, Apple's senior vice president of Worldwide Sales. "As Apple's second largest cataloger, Creative is a key part of our channel, and has helped fuel the intense consumer demand for iMac. We're delighted that it's helping us attract Mac owners, as well as first-time buyers and PC customers, by featuring iMac in all its catalogs."

MacMall was the first Apple reseller to offer 32 MB of extra RAM with every iMac purchased, as well as up to $675 of discounts on products purchased with it. The Company has established a special Internet site -- http://www.macmall.com/imac -- to help handle consumer demand for ordering iMac.

I got into Eartlink due to my transfer to Dallas, Texas from Cedar Falls, Iowa. Cedarnet.org is not available in Texas. Also, Cedarnet's usenet capabilities only extended a mile and doubt you could of read my posts. At least the email was free. I did recieve a letter concerning a complaint by you..However, you're whining was refuted..You should stop the personal name calling in your replies to me because it makes you look like an idiot when you whine to ISP's.

He got impeached because he fired the Secretary of Defense(Secretary of War in
those days) who was insubordinated.

It's exactly what I said..He can't be bounced except for treason cause he did
not committ a felony.

What grandjury did he misled? The Paula Jones civil suit was thrown out
before it reached a courtroom. Starr will never prove Clinton tried to
influence Monica. Give me a break...This shows that Starr is grasping for
straws and that WhiteWater, Travelgate, filegate and any other gate you want
to ad have come up empty..

> >Don't tou wish to be a macho stud, chunks?

>I guarantee that this will be my only post on the matter :)

OK, THIS will be my last post. Just realised I didn't include any
sources.

Resolution Trust Corporation: _The Nation_ 3/18/96,
New Yorker 4/22/96

Leaked information: Recent news articles.
New Yorker 4/22/96

International Paper: _New Yorker_ 4/22/96

And more, but they're misplaced at the moment. And here's one more
quoted article that is interesting in light of his investigation of
Whitewater. (_The Consortium_ 3/28/96; _In These Times_ 4/29/96)

Starr Refuses to Detail Early 80s Real Estate Deal

Kenneth Starr refuses to provide details of an investment in the
Lubbock AK LTD real estate partnership, which he made in the early
1980s. All that is known about the investment is that Starr never
claimed on his tax returns the @20,000 he says he lost on what was
described as "a start up exploratory fund for possible acquisition of
property" in Texas. Circumstantial evidence suggests that the AK
initials in the investment could stand for Iran-contra arms dealer
Adnan Khashoggi, who was involved in Texas real estate development in
the early '80s.

Geeee.... where does Whitewater end & Lubbock AK LTD begin. Sheesh.

& As far as a person just realising that a President is a fibber - how
do you think he got into office in the first place? Simply too many

groups, going after too many divergent goals for a politician of _any_
party to hope to get elected without telling fibs.

<slap> Shut Up Terry! This is comp.sys.atari.advocacy! -- OK, I
promise... I did really only want to give the sources <grin>

I use an AMD k6 @166MHz with 48Mb of SD RAM, a 24x CD-ROM drive, a 2gig HD, a 33k modem, a stereo 16-bit wavetable synthesis soundcard and a 4meg SVGA graphics card ...

i use it a lot for the internet looking for news about and software for my Atari STe @ 8MHz with 4Mb of RAM and a 20Mb HD, the happy workhorse at the heart of a semi-pro recording studio ...

comparing clock speeds alone the pc is 20x faster than the STe, it has 12x as much memory and 100x as much HD space ... but then the pc cost 1200ukp whereas the STe cost me a 1/20th of this at 60ukp ...

ironic huh?

jim

Yeah, I moved from SGI to PC about 8 months ago. SGI deciding to build NT PCs
was like a kick in the stomach and made us look at PC solutions. OTOH, it's
nice to be able to do development at home without hauling $40000 of equipment
home every night (I had to get personal insurance to cover it).

But I also realise that my time is worth more than a PC. My personal workstation used to be an Octane. Spending a few grand on a new computer is worth-while even if productivity only goes up a few percent.

> Got a good example of a 'useful' Shockwave?

I don't have a URL handy. The last conference that I went to had a Shockwave version of the Director presentation on the web.

> ...and you rather likely use special purpose hardware

> PC).

Of course. Oxygen cards are pretty popular at work these days. But I can get them for my PC and I couldn't for any Atari.

Redmond is still trying to catch up with MountainView. For the next few years,
at least, my productivity is very proportional to the speed of the computer
that I use.

6 months ago we were asked at work to disable Java (I forget the reasons
why)
and to tell you the truth I have not noticed *any* difference at all
while
surfing. This makes me curious as to what the hell Java is used for?
Whatever it is used for, I never used it or came across it while
surfing,
so what is the big deal??
One thing that pisses me off I'll say is so called reference CD's that
are
propriatory, hooked into some OS. I've yet to see a reference CD that
had
effects that were any different than what I can do on the web. So I have
a CD that can only be used on a MAC or a IBM, not an Amiga or an Atari.
If that reference CD had been writen as if for the web, then _everyone_
could use it. UNiX(Linux), Amiga, Atari, MAC, IBM(DOS or Windows),...

Oh man... PCs are bland, Macs are far from bland. No other computer
has this huge following, almost a religion, behind it. Not even your
precious Ataris. Not even the "cult" Amigas.
I'd take an Atari any day over that Pentium II you lust for. Of
course, I'd much rather have an iMac :)

GEOS? I beg to differ. If there's something that looks like GEOS,
it's GEM, not MacOS. You're right about the Mac using non-standard stuff,
blame it on Steve Jobs.
But Ataris are also problematic. I'm currently facing a big problem.
No composite output, no "standard" RGB output. I can only use the stupid
b/w monitor or a freaking RF modulator. Dang...

Hahahaha!!! YOu're advocating the 8.3 DOS filesystem now?! That's
really stupid, you know...

> Yup, Apple was being real innovative there. As long as you consider
> stealing Xerox Palo Alto Research Centers Ideas part and parcel and
> not only claiming them to be your own, but having the gall to try and
> sue other companies that attempted to use a GUI.

No matter what you say, Apple was innovative back then. What
machines were available in 1984? Any Xerox machines that you could buy?
Don't think so. People were stuck with DOS (8.3!) text mode.
Guess what. If it weren't for the MacOS, Amigas and Ataris
wouldn't have a GUI.

>
> Atari wasn't shouting "Me too!" Atari had an innovative system

Ataris didn't had colour in the productivity mode (640x480), so
there. OK, you said Atari was keeping up with the rest of the world. But
the thing is, they were trying to keep up with Apple's developments!

> yet again.

Humm... Wrong. Macs aren't obsolete. Vintage Macs can do exactly
the same as your vintage Atari can do, even more in cases, due to the
abundance of software.
You have to realize that nobody's forcing you to use the latest,
greatest versions of the software out there. That's the difference. While
Atarians are stuck with old versions of their software, Macs have an old
backlog of software that users can choose from.

You should be. I don't see what's lacking in the current product
line that would appeal to you. What would a "good product" be for you?
Apple's constantly upgrading and enhancing their products. Third-parties
are also releasing more and more upgrades, boards, etc. For once I'm able
to say, the future looks great. I wouldn't tell you this a year ago.

>There is an on-going discussion in comp.sys.next.advocacy
> about how Apple is ruining OpenStep (my favorite operating system) to make it

> line.

No, they didn't. MacOS X Server (previously known as Rhapsody)
has the command line intact, and can run MacOS applications in a
controlled environment. MacOS X will mix classic MacOS and OpenStep. It'll
be a consumer-oriented OS, which OpenStep (or any Unix for that matter)
wasn't, so don't expect command lines and things like that. That's why
they kept Rhaps.. ermm.. MacOS X Server :)

Why not. An OS not merely designed to steal other people's
innovations should be able to manage more than just FAT12
and still be able to format an ext2fs floppy should
portability be no concern.

Yes actually. They came out in '83. They were just somewhat
high end rather like Macs actually.

>Don't think so. People were stuck with DOS (8.3!) text mode.
> Guess what. If it weren't for the MacOS, Amigas and Ataris
>wouldn't have a GUI.

No, they just would have stolen the idea from it's source
or the Athena team. Phoenix and Compaq did more to bring

the GUI to the masses than Apple ever did. Apple 8bits
were selling for 3x what my ST cost me when I got it.

Sure & when an Atarian wants to run MSWord or IE, they can
just get the $100 or $500 clone special and save a bundle
and run a whole bunch of 2nd tier cheap games while they're
at it.

There were a lot of better games that you didn't see, then, such as Frontier.

As for professional 3D, I take it you are refering to raytracing and the
likes. Granted, the Atari was never much of a contender there, all the good
programs were/are for the Amiga, but that was the case with most other
platforms, too.

NVDI has drivers for most new printers. Still, I wouldn't mind if we all got
Postscript, instead of lots of disparate standards.

>> Macs used to sell for more than new cars.

>True enough. Ataris were as cheap as dirt and about as useful as dirt when
>performing computing tasks.

They were cheap as dirt, not luxury articles for the people who already had
everything. And things could be done with them. For those who couldn't afford
a Mac SE with its 9" screen and Pagemaker, there was the Atari with Calamus.
For practically every MIDI musician, there was the Atari with its built-in
MIDI ports and Cubase.

>> So? How much does your T1 cost you?

>I don't have a T1 at home. A lot of those technologies are pretty easy on
>your bandwidth.

Not to mention quite useless. Novel at first, perhaps, but they haven't found
their way onto any PC or Mac I've been using.

Sorry I missed this one before...

<THWACK>(tm)

Printer drivers are not a problem, actually as that sort of
thing is available OpenSource and has been for quite a while.

>

Actually, streaming audio and video can be problematic even
on a cablemodem. The catch with these things is that you're
dependent upon every node in the chain between reciever and
sender. A bottleneck in any one of them and your nice media
toy goes out the window.

It would need to have fast 2D and 3D graphics. It would need to have three free PCI slots. It would need to have preemptive multitasking. It need to have fast file I/O. It would have to run some of the more important 3D applications such as Wavefront and SoftImage. It would have to have a memory architecture capable on handling large working sets.

No, they didn't. MacOS X Server (previously known as Rhapsody)

Apple hasn't committed to updating Mac OS X Server beyond it's initial release. That will probably make it a dead product before it even ships. Taking away the command line is just restricting the user for no reason. And, keep in mind, command line utilities are useful for GUI programs. For example, say I wanted to add a check box in the save dialog of my application so the user could choose to automatically compress the file upon save. In OS, that would probably take about 5 lines of code because I'd just call gzip. Without the shell and standard utilities, how would I do that in Mac OS X?

Well, there is the point that a significant proportion of the postings
are actually discussing the capabilities of Atari computers, although
someone looking at the subject lines would never be able to guess
that. May I suggest that if you are going to complain about
Atari-related postings being posted in a thread with a Mac subject
line, that you don't put the post into a thread with a Mac subject
line? :) - That's a joke, btw... seriously, start a thread.

What Atari clones can use Voodoo 2 cards? Are this Intel based? Who writes for drivers for these cards?

Any machine that has PCI bus and a gcc compiler most likely...
Although 3Dfx could have goofed with glide and made it x86
specific.

You really should know just a 'little' about 3D chipsets
if you're going to rattle on about polygon counts and such...

There are no PC Voodoo II cards that will work on a Mac so I would assume that there is some component (hardware or firmware) that is tied to the PC architecture. If you want a Voodoo II card, for then Mac, then your only choice is the GameWizard.

> You really should know just a 'little' about 3D chipsets
> if you're going to rattle on about polygon counts and such...

Why do you think that I know less than a "'little' about 3D chipsets?"

BTW, are there any shipping Voodoo II cards that work in anything other than full-screen 3D mode? If not, then they are pretty useless for doing SV work. I personally have an Oxygen 202 card in my work computer. It scores about 19 on CDRS-03 and was only $2000 Canadian. That's slightly better than a low-end Octane. How do the Voodoo II boards do?

And could you please both some more information about the Atari compatibles that you were refering too?

Why shouldn't a consumer-oriented OS retain the CLI? Both AmigaOS and Windows
do.

I think the design of the ST/Falcon case was nice. The keyboard computer
design is not very space-demanding, and portability is easy, too. I find the
function keys integrated into the case a rather nifty design, too.
Of course, old Macs are cute as well, but the big boxes are very ugly.

They're all black and white, I can't see much difference. They all had
windows, menus, sliders and gadgets.

> But Ataris are also problematic. I'm currently facing a big problem.
>No composite output, no "standard" RGB output. I can only use the stupid

Looking in a Datic catalogue from a few years ago, I find a Scart/Peritel
cable for the ST, connecting to the monitor output. Is this what you're
looking for? Anyone with a soldering iron should be able to construct one for
you.

Drivers for Insmell cards are not such a problem. Computerinsel has
been doing this for quite some time for TOS machines. But, as the
posted stated, some pleading would probably be necessary. There are
probably enough Hades, Medusas and Milans to temp them

In his recent attacks against my credibility (which has so far been monumental failures, owing to his lack of same), TIFKAS (the Idiot Forever Known As Sinclap) has made claims that President Bill Clinton cannot be impeached if any charges regarding the allegations he deliberately conspired to mislead a grand jury over Monica Lewinsky come to bear, as a president "can only be impeached for treason".

BZZZZT! WRONG! Here's what I found in the Groliers Encyclopedia CD-ROM when I went to search under "impeachment". Read it and weep, weinerhead......

FROM THE NEW GROLIER MULTIMEDIA ENCYCLOPEDIA, RELEASE 6

impeachment

{im-peech'-ment}

Impeachment is the first step in the process specified in the Constitution of the United States for removing the president, vice-president, or other government official from office upon conviction of "treason, bribery, or other high crimes and misdemeanors." The House of Representatives has "the sole power of impeachment," that is, the power of bringing charges. The Senate has "the sole power to try all impeachments." A two-thirds vote is required in the Senate for conviction. When the president is to be tried, the chief justice of the United States presides. Conviction in an impeachment proceeding results only in removal from office and disqualification to hold "any office of honor, trust, or profit under the United States." A person convicted in an impeachment, however, is subject to further "indictment, trial, judgment, and punishment according to Law."

Impeachment originated in England, where the House of Commons would present articles of impeachment to the House of Lords, which then tried the case. A well-known instance was the impeachment and trial (1786-95) of Warren HASTINGS, first governor general of India.

The framers of the U.S. Constitution, although committed to a separation of powers and independence of the three branches of government from one another, believed that a means must be provided by which officers thought to be guilty of significant misconduct could be tried and removed. They did not want the procedure to be overly simple to invoke, nor the penalty too easily imposed--hence, the requirement of the two-thirds vote for conviction in the Senate, and the stipulation that impeachment be for "treason, bribery, and other high crimes and misdemeanors." To George Mason's suggestion

that "maladministration" be a ground for impeachment, both James Madison and Gouverneur Morris objected that so vague a term would surely produce the result that tenure in office would be at the pleasure of the Senate.

Since the adoption of the Constitution, only one president, Andrew JOHNSON (1868), has been brought to trial in the Senate on charges voted by the House. The Senate failed by one vote to convict Johnson. In 1974 the House Judiciary Committee voted three charges of impeachment against President Richard M. NIXON (see WATERGATE), but he resigned from office before the charges could be voted upon by the House.

Impeachment proceedings have been brought with some frequency against federal judges. In 1804, Supreme Court justice Samuel CHASE was impeached on purely political grounds, but his acquittal (1805) effectively halted the use of impeachment to remove judges for political reasons. It has often been said that the cumbersome and time-consuming process of impeachment is unsuited to the removal of a merely venal judge. Nevertheless, because the Constitution specifies that judges hold office during good behavior, impeachment remains the only means by which a federal judge may be removed.

Certain questions concerning the impeachment process have persisted: whether it is judicial or political in nature; how to define high crimes and misdemeanors; and whether a conviction can be appealed to the Supreme Court. Although no conclusive answer can be given, it is safe to say that the judicial process of impeachment will always be infused with political motives; that the definition of high crimes and misdemeanors will never become entirely precise; and that once the Senate has voted to convict by a two-thirds majority, the Supreme Court is unlikely to take jurisdiction.

Valerie A. Earle

END QUOTE

I also fail to see how being in violation of the US Tenure Act (a charge trumped up by those senators opposed to Andrew Johnson when he fired his Secretary) can be seen as "treason". Also note that Nixon had THREE charges of impeachment (which he deserved) placed against him - I'm sure all three charges were NOT "treason".

Now how did the University of Iowa (a good accredited US university) manage to give a sheepskin to such an unmitigated schlemiel like TIFKAS? Maybe he was playing Space Invaders on his Mac and playing hooky from his political science class the day his kindly old history professor talked about impeachment. Or more likely, he was too busy in the library playing his childish flaming tactics on the USENET that day.

In any case, TIFKAS has proven that when it comes to understanding the US Constitution, he is as good an expert as General Alexander Haig was the day Reagan was shot - and like Haig, neither of them are in control (the fact that both TIFKAS and Haig are both tight-assed idiots who love twisting definitions and explanations - remember Haig's testimony about the nuns who were raped and murdered by right-wing troops because the nuns "were trying to run a roadblock", which he then claimed he never said - and who were both undone by putting their foot in their mouths, adds weight to my description. Haig helped destroy Commodore as part of his being part of the "Three Stooges" in charge of the company; TIFKAS destroys any interest people have in checking out the Macintosh every time he posts his self-serving drivel on the USENET)

In any case, the fact of the matter is that this information was found on the Groliers CD (a wealth of information and a recognized scholarly tool) on an ATARI COMPUTER (using my friend Peter Zalesak's SARA Groliers driver) - ironic in view of TIFKAS' continuing insistence that Ataris are good for nothing except the slag heap, and that the Mac is the superior platform (fact is, they're at par with each other, and equally useful).

The matter of the definition of impeachment is now closed. I'd also like to close the discussion of poiltics, as it is an inappropriate area of discussion in a COMPUTER FORUM. The continued debunking and exposing of TIFKAS as the world's most clueless Mac Advocate continues......

I'm not sure what this article means as the iMac would have no problems functioning on a TCP/IP network. Just go to the TCP control panel, select ethernet as the connection device and either type in your IP address or choose a method of getting an IP address dynamically. It should take under a minute to do this.

just finding little things that might be of interest to everyone, as
everyone should get the full story about the iMac, rather than TIFKAS'
mindless postings of Apple press releases. BTW, you'll also notice that
many of the links to articles I've provided do have some positive things
to say about the iMac as well - although I feel the iMac is flawed, it
does have some great aspects to it, and I'm not afraid to have those
mentioned. Let's just see how well it wears over the next year as
technology marches on......

Is this person for real? Must be a wintel intern...-)..Depending on the network that is being used, Macs can be integrated in minutes. There are Novel clients as well as NT clients like Dave.

I've noticed that perhaps for the past month or so, articles soley pertaining
to Macs have been appearing in this (comp.sys.atari.advocacy) newsgroup.
I am extremely curious as to why. I think Macs are fine computers, but I did
not subscribe to THIS newsgroup to read about Macs.
Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI,
ExtedDos Pro, ICD HD utilities.

You can also set up a Falcon running Linux to be an
Mac fileserver. However, it might not be something
one would expect the target market for the iMac to
accomplish.

For the iMac, a dhcp client and configuration utility
at least on par with what one can get under Linux
should be a bare minimum in terms of functionality
delivered in the box.

ROTFLMAO! Thanks, Jedi.

and as usual, TIFKAS gets it wrong yet again! The TT, MegaST, and
MegaSTE had expansion slots for installing graphics cards and internal
SCSI hard drives; the Falcon has an expansion slot within it for a
number of different uses and has an internal IDE interface, as well as
external SCSI. I believe that all these were new models, as well as the
STacy was.

And I would consider the release of the 1040STe a timely upgrade
that fixed many of the flaws of the original STs, including bigger
colour palate, standard SIMM upgrades for memory, stereo sound output,
improved hardware scrolling, etc. It's probably the most desired of any
used ST model. And at a much cheaper price than any Mac at the time.

The Milan I would also consider to be a timely (and cheap!) Atari
upgrade solution. Check out the web page at
http://www.milan-computer.de and weep, weinerboy (and don't use the
excuse you can't read German, TIFKAS - use AltaVista's Babelfish
function to translate it. That or invest in a REAL web browser like CAB
and get the GEMtrade module :)).

If you're going to debate, TIFKAS, at least be sure to make sure
you have all your facts straight. (That includes mindlessly parroting
Steve Jobs, who's now been caught with his pants around his ankles with
his blatant lie about the iMac's speed; see
http://www.apple.com/pr/library/1998/aug/13fast.html to show he DID say
it)

I wait with baited breath TIFKAS' reply to this, which of course
will include some lame insult and/or unproven smear against my

character (of course, it'll have to wait until he's finished watching
Teletubbies......)

The Mac was just as lacking in the expansion department as the ST line.
As for upgrades and new models, that was true, they got lazy.

However, TOS and GEM weren't overburdening the hardware
that they initially ran on either. While MacOS was rather
too fat for the original Mac hardware.

2499. New iMac sighted

Newsgroup: comp.sys.atari.advocacy
Date: 1998-09-03 00:00:00 UTC
From: grovem@ridgecrest.ca
Message-ID: <6slc5vemh1@ash.ridgecrest.ca.us>
Source record: 4610

Boy the Networks don't miss a trick to spice up a show. Tonight on
Drew Carry, Mimi now has an iMac at her desk.
It really matches her makeup and attire.........

I wonder what C-Lab could do along the lines of the current iMac
commercials. Apple really does manage to depict what owning a PC is
like, but what would real computer users think of the C-Lab case
compaired to the iMac? I guess wanting to put a VCR tape in the C-Lab
is better than wanting to put fish in your iMac.......

The person that is looking for a Mac plus can visit our local thrift
store. The Navy base DRMO sells computers by the pallet. They are the
first thing the buyers dump after the auction. They go for $5.00 each.
Get one for every door in the house.
MG

Then I will happily be reading info about Atari and TOS clone computers, which is exactly why I subscribed to this newsgroup. :)
Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI, ExtedDos Pro, ICD HD utilities.

This is the advocacy group. Goto comp.sys.atari.st for the latest software,
hardware and technical updates.. Qut whining now..

Yea right...Calling Mac OS 1.0 bloated is an understatement. Have you ever saw Mac OS 1.0? Get back to me if you had..

If I'm not mistaken this is the ATARI advocacy group. I'm not whining.
Perhaps I should start sending Atari related postings to Mac newsgroups.
Falcon030, 14mb ram, 540mb hd, 17" svga monitor, MagiC, Pagestream, NVDI,
ExtedDos Pro, ICD HD utilities.

So? What will actually run under MacOS 1.0?

All us Executor users are all ears...

If you ever should decide to move on to different
hardware, that Falcon could be quite nicely recycled
into an intranet server of some kind (linux).

True, but Atari never really seemed to care that computers became cheaper all
the time, so they just went on with TOS 2.06, despite all its limitations,
when modern computing would allow, even demand, more advanced solutions.

Most modern computing wasn't able to deliver those
'advanced solutions' without either unacceptable cost
or crippling of hardware until after RAM prices came down.

It's no small irony that Unixen are now considered trim.

Because it goes against Apple's long standing tradition of
perceivably "simple" OSes. The "core" of the OS might be damn complex, but
it has to look simple.
I like CLIs, but I think it would be a bad thing for Apple if
they included one with X (not X Server). For instance, an inexperienced
user could cause much more damage thru a CLI than with a GUI :)
Oh, and, of course, since X will be running atop a Mach kernel
and POSIX layers, it'll be possible for third parties to port assorted
shells to the X environment.

Well, the case design of the ST/Falcon is definetely 80s... Not a
bad thing, but it's not a form factor known for its expandability (see the
Amiga line and the problems with the kludgy slots).
I don't think the "big boxes", as you put it, are ugly. The Amiga

boxes are much uglier, and the Atari boxes were just... awkward :)

Hummm... By your assertion, all OSes are alike, because all of
them have windows, menues, etc... What would make them look alike is the
"feel", not only the "look", which, in this case, are totally different.

SCART? What's that?
I could've built a cable to hook it to my TV, but I can't find
the stupid 13-pin RGB cable... It's not "standard" :(

While every PC Voodoo II card should work on the Mac, only one does (the GameWizard) because there are no drivers for the others. The GameWizard is deliberately different from the PC Voodoo II cards so that you can't download the GameWizard drivers and buy a cheaper PC Voodoo II card. Who makes Atari drivers for the Voodoo II card and what API do you use to access it? Can you use OpenGL or do you have to use GLIDE?

I can reformat my hard drive with a few clicks under the Mac OS. I could also drag my System Folder into the trash and my computer would stop booting. What additional damage could I do with a CLI? In OpenStep, without having logged in as root, you can't do that much damage with the CLI.

> Oh, and, of course, since X will be running atop a Mach kernel

That doesn't help developers. OpenStep developers often leverage the built-in shell and command line tools to add important features with little effort. Apple is ending that era.

Great! Give the iMac users the true feeling of owining a PC. Sell them something one month, and release a newer product at the same price next month.

Did you read the NYT article about the iMac that caught fire in a womans apartment? She is sewing Apple for $11.7M USD.
Her lawyers claim the powersupplys in the iMac line are underrated and that every iMac user is in danger.

Encourage the spread of this message. It is a false statement on my behalf. I am not responsible for followups that do not contain this message.

Let me word that:

iMacs do not cache fire (unless you spill the water while filling it).

News aleart: Neon Tetras are known to cause screen burn if the quanity in the iMac exceeds 15 fish.

2528. iMac fish food

Newsgroup: comp.sys.atari.advocacy
Date: 1998-09-08 00:00:00 UTC
From: grovem@ridgecrest.ca
Message-ID: <6t2o3q$102$2@ash.ridgecrest.ca.us>
Source record: 4639

While at Wal-Mart this weekend, I actually seen a bottle of fish food specifically for the iMac. The feed were shaped in the form of an sad face. Twisting the can open caused it to play the death chimes of the iMac after Joe user trys to replace his memory. A rubber plug was included to seal the monitor bowl from leaks while performing this operation.

The first Neilson report released concerning the iMac said that it was most used during daytime soap operas to log onto the shows site and vote wether Charlieen should leave Rastus for having sex with her sister and recording video clips of it with her iMac. The pictures looked kind of blured with all the fish floating around the screen.

read the above again. The problem isn't TOS whiners, the problem is
bloated and buggy code from guys who favor content over quality. There
are more than just TOS people who complain about this, and you know it.
We don't live in the dark ages, either, what with all the great Internet
tools that have popped up in the last few years for the Atari, and is
still being developed. And speaking of whiners......

They are going to push the envelope on web tool
>technology to the fullest. In case you have not noticed computer power is

TOS is fine, it's the memory requirements of any jvm and
the jdk that are a problem. Since there is a TOS version
of gcc, Atari programmers are more than able to take a crack
at porting any GPLed version of java. Just don't expect it
to fit within the usual hardware memory capacity of an ST.

Nevermind that one never can tell when any arbitrary java
applet on a page will take down IE4 or NS4.

No, webmasters are still worried about the bulk of PC users
still using slow serial connections and all of the softcore
novice users that really don't have the patience to view
media in anything other than realtime.

I dunno, a linux port might be more productive.
It would be interesting to see what they could
do with a more efficient Mac/PC OS with infinite
customizability

Then many platforms, one sourcetree, one command
to build them all... make.

Or... MagiC on top of posix could be interesting...
Have the same sourcetree but just with GEM instead.
(X is horribly bloated)

2539. iMac in Texas

Newsgroup: comp.sys.atari.advocacy
Date: 1998-09-09 00:00:00 UTC
From: grovem@ridgecrest.ca
Message-ID: <6t50q4$be2$1@ash.ridgecrest.ca.us>
Source record: 4647

Beauford Lamont of Tippin Texas ask, I installed an iMac in the back of my 71 Caddy Limo. The girls seem to like it real nice between trips to the base. Is there any way I can keep the water from spilling out the top of the machine when we start head'in fer home on the back road? I've lost 6 Tetras this week alone, and my insurance company says it dosen't cover portable fish tanks.

Is there a Comp USA rep in the state that could help with this problem?

Also, Maxine wants to know if the NeXT iMac will be available in Pink.

Yours truely,

BL

indeed, one hardware independent OS then we can open up this whole computer thing again ... hold on isn't that what linux is?

Still can't use JAVA.. But you still at least have the legacy stuff still
available.

I don't have that problem with bloated and buggy code from folks.

The market does not agree with your asertion. The iMac is the number one
computer seller in August.. Maybe I will post the press release.

GUIs are more intuitive by nature. If you drag your System folder
to the trash, you know perfectly what you're doing. But, in a CLI, you
might delete things you didn't mean to, by accident. I did that many times
before, you know, rm -rf, etc...

>> Oh, and, of course, since X will be running atop a Mach kernel

>Apple is ending that era.

I don't see how. The actual release of MacOS X is too far away,
but I bet that we'll see many shells available for it. And, of course, X
Server already has a couple of them ported and working fine, in addition
to the built-in one.

ah, but how long does it load under JAVA? The thinking behind
successful web pages is that it loads quickly and immediately, as long
load and format times turn potential customers off. I've gotten lots
of praise for my web pages from users of all platforms for its
no-nonsense and FAST loading - something I wouldn't have gotten with
having JAVA aboard....

more than legacy stuff, bonehead. Try Jinnee (hot new desktop), new

version of Calamus, Smurf, Papyrus 6, NVDI 5, MagiC 6, SpeedoGDOS 5.7.
The above proves once again that you're a nebbish as far as knowing
beans about Ataris....

does the term "a fool and his money are soon parted" register?

my assertion has nothing to do with what the public buys, but from
proven test results on ZDNet.....

yawn....still no USB drives, no printers, very few peripherals, and
I can't pick them up at my local Business Depot or Grand & Toy.

It makes sense that you'd post a press release, seeing as you're
nothing but a mindless Steve-Jobs-butt-kissing parrot......

Hi all. I'm new to this news group, just been taking a look through some of the previous posts. Wow. Talk about snippy!

I had (still do) an 1040STe that I reckon is one of the best computers ever made. I have dreams of being able to use some of the software from the PC and Mac on it...

Re the Java for CAB posts - I have a Mac on which I program in Java (you guys'll hate me!). I wish there was a Java port for the ST (which ran quickly!) so that I could write my progs and still use them on the 'beast'. Has anyone considered doing a Java-to-native compiler? This would strip away a fair bit of the Java overhead.

I agree with the point that Java is slow - it's pathetic on a PowerMac! You need at least a 120MHz Mac to run anything at a decent speed. However, the idea of being able to write a program and run it on a multitude of platforms with no mods is, in my opinion, brilliant. If a fast, efficient version of something like Java was available before Atari folded, who knows - maybe we'd still have an independant computer manufacturer turning out low-priced and (relatively) high-powered computers. I may be wrong, but I believe it was largely the lack of support caused by the lack of popular software (like MS Word ... ughhhh...) for the ST that caused Atari's woes. Just when they brought out computers like the Falcon....Makes you sick doesn't it?

Enough already - I love the ST, wish 'twere still around, but from the looks, there are still some people writing for it. Who knows, maybe Hasbro will relaunch it - right after 1st Porcines take off..

'Bye

a good little computer there! I had one for about three years, and
probably would still have it if this good deal on my Falcon hadn't come
along :) But why would you want to run PC or Mac stuff when there's
quite a few programs for the ST that are pretty powerful in
their own right? Feel free to e-mail me if you have any questions about
what you want to do.

the whole sorry mess came down to the fact that the Tramiels were
so incompetant at promotion of their stuff that they couldn't market
immortality - that and that they generally treated many of the
third-party people like dirt when it came to giving them the necessary
info, development machines, etc. The R&D department, though, came up
with some amazing stuff.

Still, it'll be interesting to see what happens now with the Milan
out in Europe and coming soon to the US - this machine certainly has
many people abuzz, including some developers from the past.

>Enough already - I love the ST, wish 'twere still around, but from the
>looks, there are still some people writing for it. Who knows, maybe
>Hasbro will relaunch it - right after 1st Porcines take off..

not very likely. Hasbro does respect the brand name, though, as
they recognize its proud heritage. And you're right about there still
being a hard-core group of people writing for this platform. Three
years ago, people were saying that Atari STs weren't fast enough or had
enough RAM or system resources to properly use the 'net, and it took
the work of three people in three different parts of the world to prove
them wrong. And we're still proving them wrong to this day :)

2547. README: Resistance Effort Against the Dominance of Microsoft on Everything

Newsgroup: comp.sys.atari.advocacy
Date: 1998-09-12 00:00:00 UTC
From: Philippe Duchenne <AmigaPhil@ping.be>
Message-ID: <1156.559T588T4132513@ping.be>
Source record: 4508
Cross-posted to: comp.sys.amiga.advocacy,comp.os.linux.advocacy,comp.os.os2.advocacy,comp.sys.acorn.advocacy,comp.sys.atari.advocacy,comp.sys.mac.advocacy,comp.sys.be.advocacy

Updated 11 September 1998:

- NEW: The README network !
The banners can now also be used to expose your site from
any other sites in the network (at random).
Details on how to join are available at :
<URL:http://www.ping.be/amigaphil/pic/SBill.html>

- There are now 61 banners you can choose from,
plus 5 templates to help you to build your own.

Would you like to claim your right to exist as a non-Microsoft user ?
Are you defending Internet independence and worldwide accessibility ?
Are you supporting competition ? Interoperability ? Open standards ?
Are you dying to pie Bill Gates ? Steve Ballmer ?

Here are some more cream pies (Web banners)
to calm down Microsoft's voracity !

- PNG format (GIF available on request)
- size 400*60
- 16 colors
- nice looking :-)

- Templates included

Those banners can be found on:

<URL:http://www.ping.be/amigaphil/pic/SBill.html>

Use them as you wish, and if you like to support this creamy
campaign against Microsoft's seizure on everything,
why not join the README network ?

2548. Feasible? Anyone interested?

Newsgroup: comp.sys.atari.advocacy
Date: 1998-09-13 00:00:00 UTC
From: tross3@hamtel.tds.net
Message-ID: <6thm71$6db@news2.tds.net>
Source record: 4509

I posted this on c.s.a.st a few days ago, but haven't received any response. Hope no one objects to reading the same message (with a clarification or two) again.

Hi,

I have access to a KIP 2900. This machine is basically a scanner and laser printer for printing blueprints. The interesting thing is that it uses rolls of paper, so effectively, the only limit to the length of a printout is the length of a roll. This system will enlarge up to 400%, with exceptionally high quality.
This enlargement factor would put a standard US Letter (8.5"x11") out at 34"x44" (2.85' x 3.66'). Consider a banner consisting of 8 sheets taped end-to-end. 34" x 352" (2.8' x 29.33') - actually a little shorter if using individual sheets instead of banner paper, due to cutting and pasting. I'll let you convert this to metric as I'm just putting forth the idea at the moment, and will put a page up with full details if there is any interest in the idea I'm about to present.
I was working with the KIP 2900 today and started thinking.
Wouldn't it be an interesting project to do an Atari banner up - With a Fuji & something along the lines of foot-and-a-half high letters proclaiming "The Fuji Lives!" (or a phrase to be decided upon later) in english, and then translations into French, Spanish, Italian, German and other appropriate languages running in a smaller size underneath. It would then be covered front and back with lightweight, flexible vinyl (the iron-on type is very effective).
This banner could then be mailed to whoever was interested and willing to:
1. photograph it being displayed in their city
2. Arrange with local Atari users to sign it
3. Send the photographs back, along with a short essay about their city or involvement in the project.
The photographs would be put up on the web, for everyone to view and download. Eventually, we might even be able to put out a coffee table book describing its journey.
Hopefully, we could get some corporate/organizational/individual sponsorship in exchange for tastefully sized logos on the banner - this would be to defray the cost of postage and things of that nature.
Anyway, just a thought. Anyone have any thoughts or comments?

There is gcc for the ST, actually.

Dunno where you would find such a beast these days...

If you had a Falcon or TT you could just plain run Linux.

Source record: 4511

G'day

Thankyou for the welcome! The reason I don't use the ST much nowdays is that I need to use Java and Ada for my course at Uni, so I had to cross over to the dark side (Mac).

Thinking about it though, there is no free or convenient Ada compiler for the Mac. Now, the Ada compiler we use on the PC-contemptibles at Uni run GNAT Ada95 - the GNu Ada Translator. Could this be a case for a gcc-compatible compiler on the ST? Does such a beastie exist?

If it did this could strike a blow against the PC-owning blockheads who thinks that they invented computers! Can anyone suggest a site that would have a gcc for the ST?

I have to admit at this point that I'm not one-eyed - I also have a softish spot for the Mac. Less soft nowdays though, after Microsoft sticking their fingers into the pie...

Cheers

Just for your information, this is the latest statistics on the posts of Peter Sinclair to the different newsgroup. As you can see, Peter Sinclair's only objective is to bash Atari when he gets a chance. You can tell his timidity here, because he didn't dare post one trolling message in the PC advocacy newsgroup because they would eat his lunch, along with him (well, they would try to but probably vomit on the taste).

Get a clue Peter. You are a pathetic coward who has nothing better to do than troll this newsgroup. Get the hell off here, or at least post as many Mac advocacy messages in the Mac newsgroup, as you do on here.

For Peter's next trick, watch him troll the Colecovision newsgroup...
- Richard Hutnik

Peter Sinclair is a sales rep for Apple? If this is true, does the contents of his postings on here make you want to go out and buy a Mac?

Just curious...
- Richard Hutnik

Linux! That's Unix, yeah? I seem to remember a magazine article a few years ago, about Minix
running on a 1040STF being more powerful than a VAX minicomputer!

I might just have to ask on the c.s.a.programmer about gcc...

On an unrelated topic, how many ST users are there still in Western Australia? Are there any?
Or do I have to move to America or Europe to find like minds?

The somewhat disappointing part of all this is that Mr. Sinclair is unable to pick up the not-so-subtle hint that people don't want his Pro-Mac-used-to-bash-Atari posts on here. They are out of context for this newsgroup. Why he continues is beyond me. He would, for one, get a much favorable audience if you posted just in the Mac advocacy newsgroup. He would get a far more fierce challenge, if he cared to really debate, if he posted in the PC advocacy group. My guess is that Peter is a once burnt Atari owner (heck, there are a number of them out out there. Most of them get lives and move on) and he feels to fight this pathetically needless battle of bashing a company that no longer exists under the Atari name.

As for myself, I have some emotional sentiment for the Fuji symbol, so I pop in here ever now and then. My most recent visit to this newsgroup was trigger by a bad review of the IMac, and it reminded me of Peter, and I was curious to see if he was continuing. He was...

- Richard Hutnik

Heck, if he REALLY insists on fighting Atari, he might as well bash Midway and Hasbro which own the remains of what was once Atari.

2558. MagiC demo tonight/TAF meeting

Newsgroup: comp.sys.atari.advocacy
Date: 1998-09-16 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <35ffafc0.0@nemo.idirect.com>
Source record: 4519

I know it's a bit late, but..

tonight TAF will be putting on a demo of MagiC 5.11 at their usual location at the Rose Room in North York Centre. If you've ever been curious about this multi-tasking operating system and what it can do to improve your Atari, see you there! Meeting starts at 7:00.

TORONTO ATARI FEDERATION User Group meetings are held on the Third Wednesday of the Month in the North York Memorial Community Hall on the Lower (or Concourse) Level of the North York City Centre Library at 5110 Yonge St. at Parkhome Ave. Parking garage inside the complex. Those using public transport can take the TTC's Yonge-University-Spadina line to North York Centre Station. Meetings start 7:30 PM, $2.00 to non-members. Membership is $35 CDN a year, and includes a subscription to the club newsletter PHOENIX and full use of the TAF Online BBS. A membership in TAF IS Atari support!

TAF Online! BBS - 416-421-8999
TAF home page - http://www.interlog.com/~schrist/taf/
TAF PHOENIX page - http://www.outer-net.com/~redfrog/phoenix.htm

This is comp.sys.atari.advocacy which is defined as: attacking and defending
Atari computers. This is in context of this advocacy newsgroup charter..

Eh Beavis..the Imation Superdrive has shipped...saw one today.., plenty of
Epson printers and USB stuff. Nope..You can pick one up at one of the seven
Computer City ones - I wonder I get to go up north...Plus the countless
resellers..

Funny, I did not see a milan or hades at Comp and Computer City recently.

> It makes sense that you'd post a press release, seeing as you're
> nothing but a mindless Steve-Jobs-butt-kissing parrot......

Saids whom...

I was watching the clean up of the tragic plane crash off Nova Scotia(sp)
recently.. What I was amazed is that up north has a Coast Guard, naval
vessels and yes naval helicopters...Maybe up north can contribute some of
those fine naval assests if we down south have to go back to Kuwait and
Saudi....-)

Oh, you do? You pitch Macs as your job and you pitch them on here. How is
that keeping your professional work separate? The difference, I guess, is
that you throw out all interpersonal skills when you post on here, as you go
into this pathetic bash Atari mode. As for where you are located, I don't
care.

> > oh, NOW you've done it! TIFKAS will soon come in and have another
> > one of his hissy fits!
> Please explain..

The person you slammed in the alt.nerds.obsessive newsgroup as being one
who never kissed a girl, but inflated one, is just predicting you will come
on here and become irate once more.

> > (BTW, thanks for posting TIFKAS' posting history - confirms what
> > I've been saying all along about him......)
> Please explain...
He is commenting on my post that contained your posting statistics. These
statistics show that you are obsessed with bashing Atari, for one reason or
another. Also, I commented that you can deduce from the posting patterns that
you are a coward, because you never once posted a pro-Mac message on a PC
advocacy newsgroup. You are an obsessive coward that has nothing better to do
with his posting time than to take shots at the company that once was Atari.

Thing is Peter, that you just don't get it. You advocate the Mac on here
as a means of bashing the company once know as Atari.

> > As for myself, I have some emotional sentiment for the Fuji symbol, so I pop

I think it is WHAT'S not WHATS but I am not going to go into a bash
punctuation trip now. As for my point of this above blurb, explains a wee
bit of my background and the fact that each time I read about the IMac, I
associate you and your pathetic promotion of this half-ass machine that
doesn't even come with a floppy drive.

> > Heck, if he REALLY insists on fighting Atari, he might as well bash Midway

Me hmm... aren't you obsessive, in regards to your posting patterns. I
also think you have the wrong word here, because what I wrote above is not a
sign of paranoia. I suggest you use your library science degree and find a
more fitting term. The fact is that it is pathetic your obsession with
bashing Atari.

debate is welcome. Howver, mean-spirited drivel (which includes
bragging about being a "macho stud" and using women as doormats, making
fun of people's weight) in lew of debating the facts (which you tend to
dodge, ignore or don't have) isn't. As well as having to make up stuff
about Atari computers from whole cloth. But then, what else do we expect
from someone who can't use Viagra because it only makes you taller?

But keep posting anyway, as we all need a good laugh. After all, a
clown is funniest if his pratfalls are unintentional :)

gee, how does TIFKAS find the time to post all his mindless drivel?
Could it be that his job, bank account, car and many, many girlfriends
are as phony as the "12 30-foot high piles of Mac software" he
constantly brags about?

ask Steve what sort of favours TIFKAS had to perform in order to
keep his job with Apple (hint: his tongue and Steve's shoes)

Thanks Daniel. Let me know their thoughts on it. I talking with someone right now that was in the sign making business for many years - we're discussing the pros and cons of vinyl instead of the KIP output.

Sorry it took so long to respond. Both of my vehicles are having major problems - even though one has been in the shop for 4-1/2" & many dollars. So between work and trying to get them going I've hardly been in the house for days.

Terry

hardly. Sir Clive Sinclair, from what I've heard, is a kind,
intelligent, honest, talented individual who knows what he talks about,
wheras TIFKAS (The Idiot Forever Known As Sinclap) is the complete
opposite- indeed, TIFKAS is the "anti-Sinclair".

BTW, I love the UK - already planning my possible fourth trip for
spring. Perhaps visiting Surrey next time?

Yes it is. Simple a question of harddiskdriver.
Use HDDriver 7.5 from Uwe Seimet.
I know I can format at least the first partition in dual TOS/DOS mode.
That accounts for max 1 Gb.

Also there is something called BIGDOS going araound for free.
Makes the filesystem DOS-compatible.

CAB has nothing to do with it - that's the report I get from the ISP I use. The web browser has nothing to do with it.

Interestingly, from tests I've done with my manager, Netscape and IE4 doesn't recognize HTML files unless they have .HTM at the end of them. CAB can recognize the code right off regardless of a suffix or not.

Plus, CAB is not as big a resource pig as Netscape or IE4 and gets what needs to be done done simply and elegantly....

I guess we can add WWW browser software to the long list of things that TIFKAS is not an "expert" at......

Oh, but a lot of Atari users won't believe the facts, and will just go on
believing their little fantasies.

> >> The ST OS is very stable
> >
> >ROFL..
>
> you've already proven that you're no expert on TOS or later Atari

And you obviously are no expert on Amiga OS, otherwise you would know TOS
is and always has been the downfall of the Atari systems. The Falcon was a
fine machine, except for that pathetic excuse for an OS.

>
> >
> >> The Amiga OS is not

Yes, but where can you buy a real, brand new Atari???

Atari is dead, but the Amiga has survived... and you can still buy new machines.
In fact demand for new A4000T's outweighs supply, and there is a waiting list.
FYI, there have been, and are Amiga clones - Draco being one, and a new English made one who's name escapes me. There is also a WebTV type thing marketed in asia which is based on Amiga technology. (officially licensed)

How many companies are there still developing hardware/software for the Amiga platform compared to the Atari?

Regards,

Clockmeister.

Obviously, your ISP is having difficulty in connecting to the server of the
web site in question. It happens..

> Interestingly, from tests I've done with my manager, Netscape and

Yea, so...

> Plus, CAB is not as big a resource pig as Netscape or IE4 and gets
> what needs to be done done simply and elegantly....

Whats that suppose to mean? I don't have problems with the bloatness of IE4
and Communicator. Sounds like you are defending your browser of choice..

> I guess we can add WWW browser software to the long list of things
> that TIFKAS is not an "expert" at......

Yea so much in understanding what 404 means..

ROFLMAO!

You were actually funny this time. However, I don't think I could
afford such high priced women. Anyway, I like the nose quite a bit
shorter. I hate getting poked.

Besides, the comment wasn't suppose to be taken literally. It was
suppose to be a degrading comment (directed towards you). Get with
the program, or get out if you can't hang.

MG

I don't think so, Amiga boy. In fact, TOS is one of the reasons why
the Atari succeeded. Not having a bloated operating system that did one
thing at a time turned out to be great for a rock-solid MIDI platform
with great timing - why do you think Ataris are still being seeked out
by first-timers and pros alike? I still get fielded calls from people
on where to find hardware.

And if you don't like TOS, there are some great alternatives -
Geneva/Neodesk, MagiC 5 (which is a great operating system, accelerator
and premeptive multitasking enviroment) and Linux....

where can you buy a real, brand new Commodore Amiga? You can still
buy brand new Falcon clones (the C-LAB variety) from Titan in the UK.
>
>Atari is dead, but the Amiga has survived... and you can still buy new
>machines.

Commodore is just as dead. Or have the Three Stooges (Mehta, Gould
and Haig) up and started the company again under the nose of the
computer press? :) As for the new machines, well, all I've seen at
www.amiga.com is excuses for why the new systems are not out....

as for used value, I was at Value Village last week. An Amiga 500
(complete with plug-in hard drive and modem) was going for around $12.
A 520ST, complete with drives and mono monitor was going for $24.95.
Guess we know who is considered more valuable.....

>In fact demand for new A4000T's outweighs supply, and there is a waiting
>list.

>FYI, there have been, and are Amiga clones - Draco being one, and a new
>English made one who's name escapes me.

no place to buy them here, as the Amiga dealers here are struggling
to survive....

There is also a WebTV type thing
>marketed in asia which is based on Amiga technology. (officially licensed)

judging by the lukewarm reaction to WebTV here in North America
(kin ya say "unmitigated disaster", boys and girls), I doubt we'll be
seeing and hearing this device here any time soon. Kin ya say CD-TV....

>
>How many companies are there still developing hardware/software for the
>Amiga platform compared to the Atari?

I would think roughly the same. I'm sure if you did a simple web
search you'd find LOTS of pro software and hardware being developed -
SoftJee, MGI, Titan, Black Scorpion, ASH, Electronic Cow, Floppyshop,
Gribnif, Systems Solutions, The Upgrade Shop among others....

Not to mention the labour of love being performed by the shareware
and PD authors (Thing being a good example, an excellent replacement
desktop - so good I've registered, it's THAT good....).

Peter, who on here really gives a flying iota about a stapler that is the same color as the iMac, outside of you? You gotta be a real maroon in order to think this subject matter relates to this newsgroup at all. It is also a sad indication of your interest that you would get excitied over a stapler that has the same color as a computer.

huh?
The first A1000 could multitask in only 256Kb of RAM, hardly bloated.
That's pre-emptive multiplexed multitasking, hardly one thing at a time. In
fact Amiga OS was the first to bring this to a home computer and the Mac
still doesn't have this ability. Plenty of music software available on the
Amiga also, and the Amiga soundchip had better sound quality then the Atari
ST range.

The reason that the Falcon failed so miserably was BECAUSE of TOS.

Better check the facts Atari boy...

I still get fielded calls from people

Gateway own the Amiga, and have done for quite some time.
Developer machine in November (or thereabouts) 1998, and the new Amiga II
available around late 1999.

>

I sell A2000's regularly for $100, but I can go pick up an ST at a local
goodwill for $5.
Amiga 500 harddrives are worth BIG $$$ around here, $100 easy for the HDD
alone.

There are NO Atari dealers anywhere in Australia, but I know of three
dealers here in Perth. Ofcourse not Amiga only dealers, but dealers none
the less.
Brand new AI A1200's are in stock, sold internet ready... No A4000's
because of the shortage.

The CD-TV was introduced ahead of it's time. Kin ya say DVD???

WebTV sucks, but they chose Amiga technology and OS for it's flexability
and stability, something TOS lacks.

MagicWB is a good workbench desktop enhancer, and Dopus is being ported to the PC because it's THAT good. Hmmm, Netscape and Opera are in development and nearing completion.

Quake and Myst on Atari?, Amiga has them available right now, licensed, commercial versions. P133 performance levels on an 060/50Mhz Amiga, with 16bit video modes (PC only has 8 bit) and 100% compatible with the PC version. Full networking support.

MP3 players/encoders, many freeware.

Freeware, shareware, PD... Check Aminet, it's HUGE.

Please list the "facts" that this Atari user won't believe? (I also own
2 Amiga's) ;-)

->And you obviously are no expert on Amiga OS, otherwise you would know TOS
->is and always has been the downfall of the Atari systems. The Falcon was a
->fine machine, except for that pathetic excuse for an OS.

Bad marketing and inept leadership was the downfall of Atari Corp., but
Atari systems themselvs are fine. TOS versions from 2.06 and up (esp. the
Falcon versions) are very well featured, stable, and intuitive...

->Yes, but where can you buy a real, brand new Atari???

Several places...there are Milans, Medusas, Eagles, C-Labs MKX series,
and more...

->Atari is dead, but the Amiga has survived... and you can still buy new
->machines.

As long as hardware is still being produced, and software is still being
released, then its not dead...

->In fact demand for new A4000T's outweighs supply, and there is a waiting
->list.

C'mon Clockmeister...thats not the whole truth and you know it. I also
subscribe to Amazing Computing (fine mag, BTW), and while there is demand,
and there is a short supply, the biggest reason for the shortage is the
fact that QuickPak and Escom are currently in dispute!

->FYI, there have been, and are Amiga clones - Draco being one, and a new
->English made one who's name escapes me. There is also a WebTV type thing
->marketed in asia which is based on Amiga technology. (officially licensed)

No argument there.

->How many companies are there still developing hardware/software for the
->Amiga platform compared to the Atari?

The Amiga does enjoy much broader world-wide support, and I'll be the 1st
to admit it. However, there are still several companies that support TOS
users...and they appear to be very dedicated to the TOS market. Something
else worth mentioning is that the software is of very high quality.

Both Platforms have their problems in an Intel/Microsoft dominated world.

(didn't -2- major Amiga magazines, one in France, and one in the UK, just close down?)

Here's to hoping that 20 years from now, there are still users like you and me to defend both Atari and Amiga systems! ;-)

There are plenty of clones. Checkout Amazing Computing and the English rags..

Plus Amiga OS 5 will be out..

I don't think it's right to judge both machine solely on the basis of who made it. After all, as you can read at Curt Vendel's excellent www.atari.nu, and other locations who have something about computing history on the net as well, both systems have their merits and intermixed Atarian / Commodorian heritage. Many Atari engineers that worked on the Atari 8-bit home computer systems went to work on the joined Amiga Lorraine project by Amiga Technologies, a company which was later bought by Commodore when in turn, it's founder Jack Tramiel bought the home computer division of Atari and was followed by many former Commodore engineers. So in essence, one could say that the ST and its succesors descended from the Commodore 64, and the Amiga from the XL/XE, in a way (there even was an Atari Amiga planned under the name of 1850 XL). This mixing continued right on to the Atari Falcon, which, with all due respect, defeated the new Amigas in allmost all areas, mainly thanks to its built-in 16-bit ADAC and its universally programmable and expandable Digitial Signal Processor with its own direct connection both internally and to the outside world, which essentially provided some sort of multi- even parallel-processing possibilities (altough not as vast as the Atari Transputer Workstation, which used Inmos T800 transputers, the same technology later used by IBM's Parallel Transaction servers).

The Amiga was used primarily by graphic designers, animators, TV subtitlers and game players. The ST was more dominant in desktop publishing and music production because of its built-in MIDI-port and suitable display resolutions, as well as value for the buck. However, the ST's main succes was in Europe. In the United States, the DTP market was dominated by the Apple Macintosh.

Operating System.
AKAIK, the Amiga has its own operating system which supports pre-emptive multitasking, but has indeed its instability problems. There's a Unix for the Amiga, and for Webbrowsing there's Lynx and Opera, and also, BeOS seems to be developed for it.
For the Ataris there's Linux, Minix, OS/9, SMS2, TOS, MultiTOS (both of which have been bought by Milan Computer www.milan-computer.de and are being redeveloped and improved), MagiX (old MagiC), Geneva, MagiC, the last one being the most evolved and most modern version. There also used to be a vast

amount of PC and Macintosh emulators for the Ataris. The PC emulators were usually slower than real PC's, the Mac emulators were faster.

CLONES
The ST, and it's successors, was indeed cloned at least three times, or otherwise built through licensing. Licensed machines included C-lab's own version of the Falcon and a machine called the Sonovista (which had multiple DSP's). Clones included the GE-Soft Eagle (with support for PowerPC), the Medusa, the Milan (www.milan-computer.de), the Hades and the prototype Phenix. The Medusa was born in Switzerland, the Phenix in France and the others in the Federal Republic of Germany. Then I believe there is some development at www.wizztronics.com All of these were not mere emulations, but real machines. If you want to include emulations, there are hardwarebased Janus (which runs on PC's running OS/2, DOS, or any Windows), half hardware/half software or all-software based Gemulator (www.emulators.com) and all softwarebased emulations PacifiST for games and STonX for Unix machines. There are also ports of Atari TOS/MultiTOS-compatible operating system MagiC for PC's (called MagicPC) and Apple Macs (MagicMac) and Apple PowerMacs (MagicPPC).

PROFESSIONAL SOFTWARE SUPPORT
On the Amiga, I know Scala, a multimedia app now also ported to PC's as "MM2" with its own operating system to directly access the PC hardware. On the Atari, Cubase, Notator, and Logic were born. I believe new versions still come out for Atari first. The only AMiga with built-in MIDI ports is the CDTV, I believe. (Ofcourse, you could always buy an MSX2 machine).

I have no experience with the Amiga community, but keep hearing stories about flaming & such. In the Atari community, I rarely encounter it, well except perhaps in video gaming newsgroups concerning the 64-bit Atari Jaguar system of 1993. Just ignore those flames.

You want some good advise? Ask yourself what you intend to use your computer for, and which computers do it best, which do it cheapest and which do it with best value for money. As for expandability: the higher-end Atari models all feature either VME-buses, or in case of clones, PC-type ISA and PCI buses. All low-end models feature at least a cartridge connector which has been known to support quite a variety of peripherals and expansions. As for hard disks: newer Ataris support the cheap PC IDE standards and its varieties, and all support SCSI, SCSI2 or SCSI through an adapter. Most current Atari systems or clones also support a variety of displays. But those are the things you worry about once you have made up your mind. Considering that gaming is mainly a PC business to date, I'd say unless you run a TV studio there is not much point in buying an Amiga other than Nostalgia. As for MIDI on the PC: the Atari versions are still a lot more stable than their PC counterparts and chaper than their Mac counterparts. If you go into DTP however, Mac is still the way to go.

All in all, IMHO, you have to make up your mind first and ask others for their experiences in using the system for a set purpose. Ask them how much it cost them, and how well it works. Then decide.

I hope I've been able to help.

Werner Domroese

2598. Amiga vs Atari vs Mac (was: Re: Atari or Amiga) - depends on what you want

Newsgroup: comp.sys.atari.advocacy
Date: 1998-09-24 00:00:00 UTC
From: Q5 <q5@usa.net>
Message-ID: <6udafo$6n0@news3.euro.net>
Source record: 4359

I don't think it's right to judge both machine solely on the basis of who made it. After all, as you can read at Curt Vendel's excellent www.atari.nu, and other locations who have something about computing history on the net as well, both systems have their merits and intermixed Atarian / Commodorian heritage. Many Atari engineers that worked on the Atari 8-bit home computer systems went to work on the joined Amiga Lorraine project by Amiga Technologies, a company which was later bought by Commodore when in turn, it's founder Jack Tramiel bought the home computer division of Atari and was followed by many former Commodore engineers. So in essence, one could say that the ST and its succesors descended from the Commodore 64, and the Amiga from the XL/XE, in a way (there even was an Atari Amiga planned under the name of 1850 XL). This mixing continued right on to the Atari Falcon, which, with all due respect, defeated the new Amigas in allmost all areas, mainly thanks to its built-in 16-bit ADAC and its universally programmable and expandable Digitial Signal Processor with its own direct connection both internally and to the outside world, which essentially provided some sort of multi- even parallel-processing possibilities (altough not as vast as the Atari Transputer Workstation, which used Inmos T800 transputers, the same technology later used by IBM's Parallel Transaction servers).

The Amiga was used primarily by graphic designers, animators, TV subtitlers and game players. The ST was more dominant in desktop publishing and music production because of its built-in MIDI-port and suitable display resolutions, as well as value for the buck. However, the ST's main succes was in Europe. In the United States, the DTP market was dominated by the Apple Macintosh.

Operating System.
AKAIK, the Amiga has its own operating system which supports pre-emptive multitasking, but has indeed its instability problems. There's a Unix for the Amiga, and for Webbrowsing there's Lynx and Opera, and also, BeOS seems to be developed for it.
For the Ataris there's Linux, Minix, OS/9, SMS2, TOS, MultiTOS (both of which have been bought by Milan Computer www.milan-computer.de and are being redeveloped and improved), MagiX (old MagiC), Geneva, MagiC, the last one being the most evolved and most modern version. There also used to be a vast amount of PC and Macintosh emulators for the Ataris. The PC emulators were usually slower than real PC's, the Mac emulators were faster.

CLONES
The ST, and it's successors, was indeed cloned at least three times, or otherwise built through licensing. Licensed machines included C-lab's own version of the Falcon and a machine called the Sonovista (which had multiple DSP's). Clones included the GE-Soft Eagle (with support for PowerPC), the Medusa, the Milan (www.milan-computer.de), the Hades and the prototype

Phenix. The Medusa was born in Switzerland, the Phenix in France and the others in the Federal Republic of Germany. Then I believe there is some development at www.wizztronics.com All of these were not mere emulations, but real machines. If you want to include emulations, there are hardwarebased Janus (which runs on PC's running OS/2, DOS, or any Windows), half hardware/half software or all-software based Gemulator (www.emulators.com) and all softwarebased emulations PacifiST for games and STonX for Unix machines. There are also ports of Atari TOS/MultiTOS-compatible operating system MagiC for PC's (called MagicPC) and Apple Macs (MagicMac) and Apple PowerMacs (MagicPPC).

PROFESSIONAL SOFTWARE SUPPORT
On the Amiga, I know Scala, a multimedia app now also ported to PC's as "MM2" with its own operating system to directly access the PC hardware. On the Atari, Cubase, Notator, and Logic were born. I believe new versions still come out for Atari first. The only AMiga with built-in MIDI ports is the CDTV, I believe. (Ofcourse, you could always buy an MSX2 machine).

I have no experience with the Amiga community, but keep hearing stories about flaming & such. In the Atari community, I rarely encounter it, well except perhaps in video gaming newsgroups concerning the 64-bit Atari Jaguar system of 1993. Just ignore those flames.

You want some good advise? Ask yourself what you intend to use your computer for, and which computers do it best, which do it cheapest and which do it with best value for money. As for expandability: the higher-end Atari models all feature either VME-buses, or in case of clones, PC-type ISA and PCI buses. All low-end models feature at least a cartridge connector which has been known to support quite a variety of peripherals and expansions. As for hard disks: newer Ataris support the cheap PC IDE standards and its varieties, and all support SCSI, SCSI2 or SCSI through an adapter. Most current Atari systems or clones also support a variety of displays. But those are the things you worry about once you have made up your mind. Considering that gaming is mainly a PC business to date, I'd say unless you run a TV studio there is not much point in buying an Amiga other than Nostalgia. As for MIDI on the PC: the Atari versions are still a lot more stable than their PC counterparts and chaper than their Mac counterparts. If you go into DTP however, Mac is still the way to go.

All in all, IMHO, you have to make up your mind first and ask others for their experiences in using the system for a set purpose. Ask them how much it cost them, and how well it works. Then decide.

I hope I've been able to help.

2599. Errors in Q5's recent mega-post

Newsgroup: comp.sys.atari.advocacy
Date: 1998-09-24 00:00:00 UTC
From: catch1@my-dejanews.com
Message-ID: <6udokl$d7l$1@nnrp1.dejanews.com>
Source record: 4360

Sorry..couldn't pass this one by, now, regarding Q5's recent posting on Amiga Vs Atari.AFAIK the Atari's main strength was it's built-in MIDI port...hence it's niche was mainly with muso's etc etc. The Amiga (in no small part due to the NewTek Video Toaster and Lightwave) was supreme in the field of low cost, high quality video work.Q5 is correct in saying both machines to share a kind of common history (Jay Miner) etc etc but the buck stops there. Now..the Falcon seemed to be a sweet enough machine..I have never seen one so I can't say for sure, but the designed/built but never released Amiga 3000 + (AGA) with DSP etc would have eaten it for breakfast. The Amiga has a brilliant pre-emptive multitasking Operating System that does not! show any untoward stability problems contrary to Q5's opinion. Other supported Operating Systems are MacOS (68k right now but PowerMac soon) Various Unix variants....NetBSD, Linux68k, PPCLinux, even a debian port. You can even run Windows 3.1 or 95 (albeit very slowly indeed) Since the arrival of PowerPC add-on cards for the Amiga the big thing has been 100% PowerMac compatibility which is promised via FusionPPC (avail real soon)....the other 2 main 68k series cpu Mac emulators (Shapeshifter and Fusion68k) both boast better-that-"real-Mac speeds, but the PC emulations are slower due to on-the-fly cpu instruction transcription.. The Amiga gives you a GUI and a shell, the best of both worlds, plus it's still in active development and has been purchased by Gateway2000. I must confess I'm unsure of the Atari's present situation, but I suspect it's a dead platform with no new machines planned or being manufactured now, but I must stress I don't really know about that..I'm probably wrong there. The Amiga is being cloned right now...go to the Amiga Web Directory for more info on that, and it's also currently available with a choice of cpu's..from the humble 68020 right up to the 233Mhz 604e PowerPC with a 50 Mhz 68060 co-pro. You can run Amiga s/ware on a PC via the Universal Amiga Emulator (slow..clumsy but works), although I'd just stick to a "proper" amiga myself..:-) AS for Professional Software Support, let me say..it's all there mostly for the Amiga. YOu can get a variety of browsers (no..we don't use Lynx Mr Q5!)..Ibrowse, Aweb with Java, Voyager, with things like Opera and Netscape on the way....Imagine manipulation, Trackers..sound sampling....music..graphics...rendering....DTP....Word Pro...you name it..the Amiga most likely has it..so don't be scared into thinking there's nothing available on the platform. MIDI is avail for the Amiga.has been since the year dot..although not as good as Atari I expect .the new Prelude Soundcards offer extremely good MIDI by all accounts..plus the usual like high speed serial ports, DSP etc etc. The Amiga conforms to standard IDE and SCSI interfaces.....so there is no probs connecting that new HD, scanner or whatever. YOu even get to choose...you want SCSi I, II, Wide, Ultra? 24 bit graphix at crazy res is avail via things like the Picasso Iv card, the CVPPC card based on the Permedia II chipset....CV3d etc etc..Video modules, TV in a window..etc etc.. Better than CD quality CD sound,

Framegrabbing..genlocking....you name it. Anyway, I'd like to stress I don't mind the Atari, I had a ST for years, but Q5's post was very biased indeed....so here I am going out to battle to set the record straight.....btw..it was once said that an Atari was simply an Amiga with all the cool stuff taken out!.....*ok, ok..I'm sorry* Anyway.....rant ends now....hey!..'least it ain't a PC, right?...;-)

>> does the term "a fool and his money are soon parted" register?
>
>That comes to mind when one parts so much currency for the Hades and
Milan..As
>Steve Jobs would assert..Yesteryears technology for todays price..

Until you learn to appreciate its openness. If you don't want it, you could always hack it into a PC-contemptible. Does an Atari need multi-billion terabytes for its software to run smoothly, elegantly, and most of all, functional and bugless? Does it need a 128MB memory to run this software? No. Could it use 128MB's? Ofcourse it can. But why use it if you don't need it.

>
>> my assertion has nothing to do with what the public buys, but from
>> proven test results on ZDNet.....
>>
>> yawn....still no USB drives, no printers, very few peripherals, and
>> I can't pick them up at my local Business Depot or Grand & Toy.

Try www.milan-computer.de ...

>
>Eh Beavis..the Imation Superdrive has shipped...saw one today.., plenty of
>Epson printers and USB stuff. Nope..You can pick one up at one of the
seven
>Computer City ones - I wonder I get to go up north...Plus the countless
>resellers..

Well, in Germany and the Netherlands I did hear rumours about someone making those LS-120 drives (surpassed by Fuji's 200MB HiFD drive btw) connectable to Ataris. Even using a parallel port. Erm... come to think of it.. why don't you just look up the lates version of HDDriver. And last but not least - why would I WANT to connect a mass storage device to a parallel port when I have SCSI at my fingertips?

>Funny, I did not see a milan or hades at Comp and Computer City recently.

I don't see any iMacs in European retailstores either. What was that again you said about yesteryears technology?

Oh btw - did you EVER find out where Steve Jobs started out? Check out Curt's www.atari.nu

And last but not least: didn't he also have a thingy called the NeXT with operating system NeXT Step? Remind me how much a NeXT _used_ to cost in comparison with say, an Acorn RISC PC or Archimedes? Are the NeXT boxes

still around? Are Ataris still around? Are NeXT boxes being cloned? For how long was the Mac being cloned? For how long could you have used an Atari to run Mac software using the Spectre GCR? Hmmmmm. Since you have all the answers, I think I speak for many that we would love to hear from you (or not).

:-) Cheers

> Funny, the local Computer City here only has one USB mouse
> and one USB keyboard...

In addition, why would anyone WANT a USB keyboard or a USB mouse? Do I need a faster keyboard? It keeps up with me just fine you know. If they want USB, they should promote it using ADSL modems and such, not keyboards and mice. Geez.... Yeah lets hook up EVERYTHING to one serial bus. All peripherals, including the priority ones like controllers. That will increase you performance, and decrease a chance of faults, glitches, sluggish response and such.

2602. Let's all buy Macs!

Newsgroup: comp.sys.atari.advocacy
Date: 1998-09-24 00:00:00 UTC
From: Q5 <q5@usa.net>
Message-ID: <6udore$pus@news3.euro.net>
Source record: 4363

Why? So we can run our Atari software using MagicMac, to keep the MacOS out of it. To heavy on resources. Geez people. I don't mind seeing an occasional Mac posting, but let's not forget our identities here. This is comp.sys.atari.advocacy isn't it? So Peter, if you have something useful to contribute to us, feel free to post. If not, why bother? Has Apple become so arrogant and desperate that it needs us Atarians to all buy Macintoshes in order to survive? Because we are more easily convertible than PC-contemptible owners do? Should we join Microsoft?

Come' on, everybody can make their own choice. But if you want to convince us, you'll have to promise that Apple buys and licenses all Atari technology from Hasbro and starts making Ataris again. Or send me a Mac for Christmas. I am not a Mac-hater. Actually, I love Macs over PC's. But I think that it is important that we all have the right to our own ideas, feelings, likes and dislikes. So, a bit more diplomacy in postings and replies would be advisable, I think.

Nevertheless, it never hurts to stirr up some discussion (in a civilized manner). What does it accomplish to get flamed?

I hope this provocative posting might ease everyone a little bit. Let's talk not terrorize.

WOULD HAVE - the Falcon is not vaporware, but Available. As for the A3000, I
believe that that one should have been compared to the planned but not
released high-end Falcon, the Micro Box or Falcon 040 (ask Curt, he knows a
lot more about it than I do).

>pre-emptive multitasking Operating System that does not! show any untoward
>stability problems contrary to Q5's opinion.
Who - hold your horses. What I meant, and admittedly poorly translated into
words, to say was that there was somewhat of a "common belief" to this. I
know people with Amigas who never complained about it, so there. :-) Let's
not get hostile.

Other supported Operating

don't
>mind the Atari, I had a ST for years, but Q5's post was very biased
>indeed....so here I am going out to battle to set the record

Like I said, I did not mean to be biased and I said nothing whatsoever to
take down any system. On the contrary. I am admittedly an enthusiastic Atari
user, and I wish to augment my collection with Amigas(!). So there. Anyway,
almost anything you can say about the Amiga regarding third-party software
and hardware support is (I _think_), also true for the Atari, so you do have

a choice.

Anyway, thank you for replying. But please, let's keep everything on a civilized and objective level. I clearly said _AFAIK_ (okay I misspelled AKAIK) because I wanted to indicate that I do not have enough experience in the Amiga scene to give exhaustive info on that. So I didn't. That is why there's more on Atari in there.

I hope this cleared things up. There's nothing like a good discussion. Now, err. can we go back to Non-Motorola bashing? *grin* ;-) (I'm sorry I just couldn't let it pass by...)

This is true

>Amiga also, and the Amiga soundchip had better sound quality then the Atari
>ST range.
Well, like the Amiga can have MIDI-ports retrofitted, so can the Atari have audiocards retrofitted. They were just into different kinds of music. And if I were to play games, I would prefer the Amiga yes. But when it comes to MIDI, there were just (I think) more and better titles available at the time for Atari. Ofcourse MOD files were the Amiga's domain to start with. But both have earned their merits. And I think that at least with the introduction of DMA-sound the STE's and TT's (50kHz 8-bit stereo) have reasonably - admittedly too late - come back, and the audio qualities of the Falcon (8-channel 50kHz 16-bit stereo DMA without using the DSP) are certainly unqestionable. And for the clones, there's also an (over-expensive) 24-bit studio audio card avaliable, somewhat comparable to a SoundBlaster Live I think. (I have to look up the FAQ of that audio card, it's available over here in the Netherlands though).
>
>The reason that the Falcon failed so miserably was BECAUSE of TOS.

No. The main reason IMHO was the dispute between Jack Tramiel and German Atari-head Alwin Stumpf. Tramiel wanted to go into consumer market, Stumpf into the professional one. Most people hoped for a better Falcon casing and presentation. Support was just cut off right after the introduction of the MicroBox prototype (68060 Falcon with a couple of VME and/or PCI slots). Then suddenly, Atari decided to focus on and market their Jaguar system (64-bit RISC game console, 1993). Ofcourse, Atari and marketing under the Tramiel reign... especially in Europe? I don't know - no comments....
>
>Better check the facts Atari boy...

This is not worthy a reply
>
>
>> Commodore is just as dead. Or have the Three Stooges (Mehta, Gould

>the less.
>Brand new AI A1200's are in stock, sold internet ready... No A4000's
>because of the shortage.

What kind of petty stuff is this? Why not develop a common environment for
both Amigas and Ataris (without necessarily resorting to Minix or Unix /
Linux). Would be
nice. A common Motorola-platform could give some weight against the Wintel
monopoly. And how about portable stuff? The 3Com Palm Pilot III uses a 68K,
doesn't it?

>> There is also a WebTV type thing
>> >marketed in asia which is based on Amiga technology. (officially

>> seeing and hearing this device here any time soon. Kin ya say CD-TV....

Erm.. CD-i tried it also...
>>

>The CD-TV was introduced ahead of it's time. Kin ya say DVD???

CDTV was far more advanced than DVD IMHO. It's not reallyt comparable. The
CDTV was a real computer, like the CD32. And the first Falcons were
supposedly meant to be designed that way also, or so is rumoured, but
redesigned around the old 1040 casings in stead, having seen how popular
CD-I got and how popular 3DO got to be. *sigh*
>
>WebTV sucks, but they chose Amiga technology and OS for it's flexability
>and stability, something TOS lacks.

You clearly have not dug into TOS, have you? Are you talking disk-based TOS
1.0? How about MagiC? They probably chose Amiga OS because it has proven
itself in multimedia applications for years and because it provides a viable
platform to easily port existing multimedia ideas. (Or so I guess).

Check out Myst for the Jaguar. As for Quake, the Atari has other FPP's. The
Falcon
has 16-bit video support. PC-version was there first, but I'd love to try it
on an

Amiga. I'm not that hungry for Quake though. It's personal I guess.

>
>MP3 players/encoders, many freeware.

Surround sound ENcoders (okay so it's Falcon only)

Wouldn't it be nice to have native Amiga AND native Atari stuff in one box?
What could have happened had Atari and Commodore cooperated on their 68K
stuff. Hmm getting wild phantasies now... I think they would still compete
bigtime against Wintel.

>fine machine, except for that pathetic excuse for an OS.

I don't know. I guess it depends on what you compare it to, and what you pay for it. (It too adds to the cost of hardware you know). But perhaps you are just referring to the GUI, which was originally developed by Digital Research for PC's on an Intel-basis as GEM "Graphic Environment Manager", you know the people that made CP/M. This GEM had to be redone for 68K. All of this long before Windows or any other PC GUI's saw the light of day. It's pretty newbie-friendly though, and all versions above 1.0, except the multitasking ones, completely diskless (e.g. in ROM). I've heard that TOS itself (not the GEM) had many ties internally with C, which would make it flexible enough (although not speedy) to port and modify. MultiTOS for example, or should I say, MiNT, had some Unix-like features if I recall correctly. Again, it would've been nice had Atari and Commodore come up with a common OS. Didn't the ATW 800 feature a parallel processing modified TOS???? Could be mistaken though. Anyway, if you're not satisfied with TOS, try MagiC (or wait for the new TOS by Milan Computer).

Regards,

Werner

>don't

All of which is also available on Atari, ESPECIALLY on Falcons.
>>mind the Atari, I had a ST for years, but Q5's post was very biased
>>indeed....so here I am going out to battle to set the record
Like I said, I only said what I know of. I am admittedly no expert on Amigas
and therefore simply feel that I cannot state anything to give it the credit
it deserves (Why You did that, as anticipated). I did not bring it down
either, and if I did, I apologize for that. It is people like you and me
that remind people that they have a CHOICE.
The whole POINT of my message was to get people to THINK and make up their
own minds. I even said, ask other people (which includes you). And so you
made your point, actually, in a very ironic way (read my message carefully),
you made mine.

So what are we arguing about? I am not questioning the validity and support
of the Amiga. I was simply pointing out that there is a lot to consider in
such matters, with everyone having their own preferences and also stating
that the Atari platform is by no means "dead", or at least equally dead as
other 68K-originated platforms, including the Amiga.

Hope that clears things up as well :-)

And have been long before Amiga clones. Medusa T40 and T60, Eagle, C-Lab
Falcon, Sonovista, Hades, Milan (www.milan-computer.de) - readily available
throughout the Benelux and Germany, Phenix (www.centek.fr), and all in
different varieties.

We all agree on that :-)
It has been possible to run Windoze on the Falcon in full color as well by
the way. But who would want that? Creators of emulators have never really
gotten the point. Yes it would be nice if you could use other computer's

software on yours, but do you have to get stuck with the other's operating system and interfaces as well? No thanks...

Fair on who. All I read was a heap of Atari propaganda. You obviously know
nothing of the Amiga, otherwise the story would read quite different.

Amiga for nostalgic reasons only???
At least the Amiga still has some users.

<<snip>>
>Fair on who. All I read was a heap of Atari propaganda. You obviously know
>nothing of the Amiga, otherwise the story would read quite different.

Would it? Looks to me like you're starting an "Amiga is better than Atari"
thing. I did no such thing. And You don't know me at all, let alone my
background, or even if I'm a guy or a gal. So, how dare you judge me?

Don't get personal or flamy. Everything is mostly IMHO, or sometimes IMNSHO,
and based on what I know as facts. I did not include any fancy Amiga stuff
because I am not aware of the current status. It's been awhile since I've
been around in the respectable Amiga-scene, and obviously, the same is true
for you on Atari things (from what I've seen you post so far).

I also used to subscribe to a couple of local Dutch Amiga magazines, and
know many people who own an Amiga or used to program it in assembly
language. I just have different preferences, yes, that's true, but I still
want to add Amigas to my collection and I have no disrespect for the
platform. That does however not mean, that I am not entitled to correct
anyone claiming false or at least questionable info on Atari.

Those were my last two cents to you, have a nice life and please - feel free
to troll if you will, I'm not going to rush out and say that the Atari
platform is dead until I truly believe it is.

Indeed... Atari's been split up before. The name now belongs to Hasbro after
Atari Corp first merged with JTS, which did nothing with it. The TOS
operating system and the technology of the Falcon and its predecessors now
largely belong to C-Lab and Milan Computer, who are actively building and
selling machines. If you want one I can order you one.
>

Yes I know AGA, yes I know Denise yes I know halfbrite, HAM, SuperHAM, The FusionPPC (read about it in several Amiga mags) and all kinds of other stuff. That doesn't mean that those kind of developments don't exist for Atari. It also doesn't mean I purposely did not include it. I am not an expert on Amigas therefore I avoid putting things in there that I'm unsure of, unlike you, since you claim the Atari platform to be dead and Atari users to be non-existant. Then what am I? Did you ever read any other Atari newsgroups? Perhaps you should stick to Amiga newsgroups if you don't like me, 'cause I'm not shying away just because of an unjust personal grudge.

Look, I have experience on almost every conceivable computer and console platform on this planet, so please don't get personal.

I still believe I have been as fair as I could have been and even if I weren't, this is still comp.sys.ATARI.advocacy, isn't it?

Geez I can't believe I'm actually still replying to this. I respect both the Amiga and the Atari, I just know a little more about the Ataris, that's all. Everyone: make up your own mind, but don't enforce it upon others, please!

Hey buddy, take it easy dude!
My remarks were in no way intended to insult you. If they did then I'm sorry.

But the following statements sounded like they were implying that the Amiga was incapable/inferior to the Atari. Better research would reveal it to be not the case at all.
In any event, whichever platform one chooses to use is a matter of personal preference. At least WE (united) don't use Wintel!

I don't think it's right to judge both machine solely on the basis of who made it. After all, as you can read at Curt Vendel's excellent www.atari.nu,
and other locations who have something about computing history on the net as
well, both systems have their merits and intermixed Atarian / Commodorian heritage. Many Atari engineers that worked on the Atari 8-bit home computer systems went to work on the joined Amiga Lorraine project by Amiga Technologies, a company which was later bought by Commodore when in turn, it's founder Jack Tramiel bought the home computer division of Atari and was
followed by many former Commodore engineers. So in essence, one could say that the ST and its succesors descended from the Commodore 64, and the Amiga
from the XL/XE, in a way (there even was an Atari Amiga planned under the name of 1850 XL). This mixing continued right on to the Atari Falcon, which,
with all due respect, defeated the new Amigas in allmost all areas, mainly thanks to its built-in 16-bit ADAC and its universally programmable and expandable Digitial Signal Processor with its own direct connection both internally and to the outside world, which essentially provided some sort of
multi- even parallel-processing possibilities (altough not as vast as the Atari Transputer Workstation, which used Inmos T800 transputers, the same technology later used by IBM's Parallel Transaction servers).

Pity about the OS though... AmigaOS supports paralell processing, even KS1.3 supported it. That capability is being used very successfully with the 060/PPC combos. Little know fact is that AmigaOS was the first to support this on a home computer/OS.

The Amiga was used primarily by graphic designers, animators, TV subtitlers and game players. The ST was more dominant in desktop publishing and music production because of its built-in MIDI-port and suitable display

resolutions, as well as value for the buck. However, the ST's main succes was in Europe. In the United States, the DTP market was dominated by the Apple Macintosh.

Wasn't that a great time... Many different platforms filling different niches in the market...

Operating System.
AKAIK, the Amiga has its own operating system which supports pre-emptive multitasking, but has indeed its instability problems.

Thing of the past. Anything from WB2.0 up is pretty damn stable, moreso then Win95/98 or MacOS.

There's a Unix for
the Amiga, and for Webbrowsing there's Lynx and Opera, and also, BeOS seems to be developed for it.

Lynx???, who uses that?
Try IBrowse, Voyager, soon Opera, Netscape is being developed, and quite a few others.

For the Ataris there's Linux, Minix, OS/9, SMS2, TOS, MultiTOS (both of which have been bought by Milan Computer www.milan-computer.de and are being
redeveloped and improved), MagiX (old MagiC), Geneva, MagiC, the last one being the most evolved and most modern version.

Most of these were developed because of TOS/GEMs limitations.

There also used to be a vast
amount of PC and Macintosh emulators for the Ataris. The PC emulators were usually slower than real PC's, the Mac emulators were faster.

The Amiga has an emulator for just about anything on the market. Do you know of the ST emulator that ran on standard A500's?. Quite useable speeds too.

CLONES
The ST, and it's successors, was indeed cloned at least three times, or otherwise built through licensing. Licensed machines included C-lab's own version of the Falcon and a machine called the Sonovista (which had multiple
DSP's). Clones included the GE-Soft Eagle (with support for PowerPC), the Medusa, the Milan (www.milan-computer.de), the Hades and the prototype Phenix. The Medusa was born in Switzerland, the Phenix in France and the others in the Federal Republic of Germany. Then I believe there is some development at www.wizztronics.com All of these were not mere emulations, but real machines. If you want to include emulations, there are hardwarebased Janus (which runs on PC's running OS/2, DOS, or any Windows), half hardware/half software or all-software based Gemulator (www.emulators.com) and all softwarebased emulations PacifiST for games and STonX for Unix machines. There are also ports of Atari

TOS/MultiTOS-compatible operating system MagiC for PC's (called MagicPC)
and
Apple Macs (MagicMac) and Apple PowerMacs (MagicPPC).

Much the same story for Amiga here...
Check the English magazines for Amiga clone details, or buy a brand new
Amiga perhaps...

PROFESSIONAL SOFTWARE SUPPORT
On the Amiga, I know Scala, a multimedia app now also ported to PC's as
"MM2" with its own operating system to directly access the PC hardware.

Lightwave, ImageFX, Dpaint3, The infamous Toaster/flyer... numerous more,
with new apps appearing monthly.

On the Atari, Cubase, Notator, and Logic were born. I believe new versions
still come out for Atari first.

Some of the above (if not all) were never seen on Atari... (the Amiga apps
that is)

The only AMiga with built-in MIDI ports is
the CDTV, I believe. (Ofcourse, you could always buy an MSX2 machine).

I'm not even sure about CDTV, but a $20 adaptor fixes that problem anyway.
You did know that the Amiga has extra pins on the serial port (the ones
that are usually not used) are used for various Audio I/O didn't you?

I have no experience with the Amiga community, but keep hearing stories
about flaming & such.

Just stories... If you call defending a platform flaming then you are
right. But self defense in itself doesn't equate to a flame in my eyes at
least.

In the Atari community, I rarely encounter it, well
except perhaps in video gaming newsgroups concerning the 64-bit Atari
Jaguar
system of 1993. Just ignore those flames.

Amiga people in the newsgroups are very helpfull in answering Amiga related
questions. Sure, there are some blind fanatics who will swear that an A500
is better then a Pentium II, but these people don't frequent Amiga
newsgroups.

You want some good advise? Ask yourself what you intend to use your
computer
for, and which computers do it best, which do it cheapest and which do it
with best value for money. As for expandability: the higher-end Atari
models
all feature either VME-buses, or in case of clones, PC-type ISA and PCI
buses.

Some Amiga models have both Zorro II/III and PC/AT slots, all have Zorro capabilities.

All low-end models feature at least a cartridge connector which has been known to support quite a variety of peripherals and expansions.

As is the case on Amiga, starting from the A1000.

As for
hard disks: newer Ataris support the cheap PC IDE standards and its varieties, and all support SCSI, SCSI2 or SCSI through an adapter.

Big box Amigas had either SCSI or IDE as standard, although the A2000 did come out as a floppy only model, and SCSI was an option. Harddrives are available on ALL models, mostly SCSI.

Most
current Atari systems or clones also support a variety of displays.

As does Amiga. Graphics cards, have been, are, and are being developed for the Amiga, and certain Multisync monitors can be used with any Amiga, whilst a flicker fixer is required with others.

But
those are the things you worry about once you have made up your mind. Considering that gaming is mainly a PC business to date, I'd say unless you run a TV studio there is not much point in buying an Amiga other than Nostalgia.

This comment isn't fair at all. I could say unless you are into MIDI there is no point in buying an Atari at all, except for nostalgia.
Just as valid as your comment...

As for MIDI on the PC: the Atari versions are still a lot more
stable than their PC counterparts and chaper than their Mac counterparts.

There is one thing you don't quite seem to understand. MIDI is better on Amiga then on PC too, with the suitable MIDI adaptor. You only need to look at the software that was ported to the PC to see that. I DO agree that an Atari is better in this regard, but the difference in reality is not that great.

If
you go into DTP however, Mac is still the way to go.

That does seem to be the case.

All in all, IMHO, you have to make up your mind first and ask others for their experiences in using the system for a set purpose. Ask them how much it cost them, and how well it works. Then decide.

Agreed, but a balanced view is required. For instance, it's no good coming into an Atari newsgroup with a question like which is better at XXXXXXX Atari or Amiga.
Instead, wording the question as: What are the Ataris capability at XXXXXX Then, go to an Amiga newsgroup and ask them the same question. Compare the

results, and choose for yourself.

Well, there are my remarks. I tried to be as fair as possible.

Regards,

Clockmeister.

> goodwill. Do I live in the wrong neck of the woods, or what?

I used the American term (I believe) goodwill to describe the same thing
here in Australia. Amigas have held their value very well in this country,
but Ataris haven't.
I had to sell my 1040STfm for $20, simply because I couldn't get any more
for it but to buy an A500 would set you back $75 at least. All big box
Amigas have remained popular, as well as the A1200 and hence the price has
remained relatively high.

Early Macs sell for around $20 -$40 dollars.
XT's, well, you can't give them away and
286's are worth $10 + monitor (depending on type, EGA or VGA) $20 max.
The last 386 Tower with VGA monitor, mouse, 8Mb RAM, 3.5" 1.44Mb floppy and
80Mb HDD cost me $25.

I think that pretty much sums up the value of older PC's I guess...

Finally, a decent message. So it's possible :-) I guess al you say is true for Australia. In Europe, the Ataris have always been more popular than elsewhere (also reflected in more worldwide spread of Amigas than Ataris, that's true). However, as we both demonstrated in this thread, both the Atari and the Amiga community are still very much alive. And as long as people like you and I still exist to jump in defense of the very existence of these systems and their (to some extent common) heritage, they will not be dead and shall not go quietly. (They both made history).

Ataris retained more value in Europe than alsewhere. But what do I care? If someone wants to sell me an Atari for an amazingly low price, than I have little problem with that. Usually, truly happy Atari users are either upgrading or sticking with their systems, not sidegrading... (although I must admit I do have a Wintel machine purely for professional reasons, which also has its merits - but, I sure as h*ll did not part with my "A-team (Atari/Apple/Amiga the latter two to still be purchased at a later date)" and I never will unless someone threatened my life with a gun to my head...

Werner Domroese / Q5

PS - The PC (Pretty Contemptible? ;-)pricing's about the same here in Europe (Netherlands), wouldn't know about Mac.

You just didn't get it. USB is not meant to be "faster", it's meant
to be "easier", which means devices can be hot-swapped, and are truly plug
and play (which is currently the case with ADB devices for Macs, but not
true for most devices on PCs).
Apple didn't go for USB on the Mac because it's FASTER, but because
it's EASIER, and mind you, it's the future.

That presumes that it needed to be easier to begin with.
USB is considerably slower than other available options
while delivering little in the way of real benefit except
perhaps requireing the user to buy a bunch of new equipment
(at extra cost) and multiple hubs (also at extra cost).

Actually, USB looks remarkably like the past, a past that
many of us were glad to see gone.

It's hard to argue with this statement when you use the word "needed". In this context, how do I decide between what is "needed" and what is "wanted" or "desirable"?

> USB is considerably slower than other available options
> while delivering little in the way of real benefit except

USB is cheap. While using USB to connect your printer or scanner is not the fastest solution, it is an easy and cheap solution. Ethernet printers are still fairly expensive and many new PCs only have a single parallel port. Also, USB is meant to connect keyboards, mice, joysticks, tablets, gamepads, etc. You don't think that USB is appropriate for these devices?

I couldn't decide if you meant that ADB is hot-swapable so I'll point out that
it is not. Also, USB PnP is much better than ADB PnP because there are serious
device uniqueness problems with ADB.

A lot of Ataris problem was that they didn't get the Home Computer market they deserved as many people saw them as a Video Game Producer and therefore unable to make a real computer. I like my Atari 800XL and my Commodore 64 equally well; I grew up with a Commodore 64 yet I like the 800XL's features a lot more. Macs and iMacs can all crash and burn in hell, and I hope someone with sense takes over Microsoft someday. All for now.

Could someone please give me the pros and cons of the both the Amiga and Atari ST? Thanks.
I don't think it's right to judge both machine solely on the basis of who made it. After all, as you can read at Curt Vendel's excellent www.atari.nu, and other locations who have something about computing history on the net as well, both systems have their merits and intermixed Atarian / Commodorian heritage. Many Atari engineers that worked on the Atari 8-bit home computer systems went to work on the joined Amiga Lorraine project by Amiga Technologies, a company which was later bought by Commodore when in turn, it's founder Jack Tramiel bought the home computer division of Atari and was followed by many former Commodore engineers. So in essence, one could say that the ST and its succesors descended from the Commodore 64, and the Amiga from the XL/XE, in a way (there even was an Atari Amiga planned under the name of 1850 XL). This mixing continued right on to the Atari Falcon, which, with all due respect, defeated the new Amigas in allmost all areas, mainly thanks to its built-in 16-bit ADAC and its universally programmable and expandable Digitial Signal Processor with its own direct connection both internally and to the outside world, which essentially provided some sort of multi- even parallel-processing possibilities (altough not as vast as the Atari Transputer Workstation, which used Inmos T800 transputers, the same technology later used by IBM's Parallel Transaction servers).
The Amiga was used primarily by graphic designers, animators, TV subtitlers and game players. The ST was more dominant in desktop publishing and music production because of its built-in MIDI-port and suitable display resolutions, as well as value for the buck. However, the ST's main succes was in Europe. In the United States, the DTP market was dominated by the Apple Macintosh.

Operating System.
AKAIK, the Amiga has its own operating system which supports pre-emptive multitasking, but has indeed its instability problems. There's a Unix for the Amiga, and for Webbrowsing there's Lynx and Opera, and also, BeOS seems to be developed for it.
For the Ataris there's Linux, Minix, OS/9, SMS2, TOS, MultiTOS (both of which have been bought by Milan Computer www.milan-computer.de and are being redeveloped and improved), MagiX (old MagiC), Geneva, MagiC, the last one being the most evolved and most modern version. There also used to be a vast amount of PC and Macintosh emulators for the Ataris. The PC emulators were usually slower than real PC's, the Mac emulators were faster.
CLONES
The ST, and it's successors, was indeed cloned at least three times, or otherwise built through licensing. Licensed machines included C-lab's own version of the Falcon and a machine called the Sonovista (which had multiple DSP's). Clones included the GE-Soft Eagle (with support for PowerPC), the Medusa, the Milan (www.milan-computer.de), the Hades and the prototype Phenix. The Medusa was born in Switzerland, the Phenix in France and the others in the Federal Republic of Germany. Then I believe there is some development at www.wizztronics.com All of these were not mere emulations, but real machines. If you want to include emulations, there are hardwarebased Janus (which runs on PC's running OS/2, DOS, or any Windows), half hardware/half software or all-software based Gemulator (www.emulators.com) and all softwarebased emulations PacifiST for games and STonX for Unix machines. There are also ports of Atari TOS/MultiTOS-compatible operating system MagiC for PC's (called MagicPC) and Apple Macs (MagicMac) and Apple PowerMacs (MagicPPC).
PROFESSIONAL SOFTWARE SUPPORT
On the Amiga, I know Scala, a multimedia app now also ported to PC's as "MM2" with its own operating system to directly access the PC hardware. On the Atari, Cubase, Notator, and Logic were born. I believe new versions still come out for Atari first. The only AMiga with built-in MIDI ports is the CDTV, I believe. (Ofcourse, you could always buy an MSX2 machine).
I have no experience with the Amiga community, but keep hearing stories about flaming & such. In the Atari community, I rarely encounter it, well except perhaps in video gaming newsgroups concerning the 64-bit Atari Jaguar system of 1993. Just ignore those flames.

FYI, Mr. Amiga, Myst has been available for Atari since the Jaguar CD VGS. Amiga sucks. WebTV sucks, but I use it. If it were based on an Atari platform, it would have greater potential.

It doesn't really matter, actually. All of those imply
the exact same thing: something is missing.

At least they're available. Also, it's rather difficult to
say whether that cost has any real bearing on the realities
of cost.

>Also, USB is meant to connect keyboards, mice, joysticks, tablets, gamepads,
>etc. You don't think that USB is appropriate for these devices?

When considering that they were being connected just fine
before with lack of muss or fuss, NO. Having seen what can
happen on a broadcast bus network when stations are mal-
configured I have no interest in having either any of my
high speed peripherals or my primary input devices attached
to one.

The question remains: just what was broken & why the pressing
need to replace interfaces and devices that work perfectly well
as is.

Well said......actually I hope I didn't give the impression I was "bashing" at all, I must say it was a bit late at night when I posted initially and, as per usual I'd been copping some flak from the usual mob of Wintel Wintendo "drones" about why if the PC isn't any good how come 85% of the ppl on the planet seem to have them *sigh* Of course, the same arguement applies to Eastern Bloc Trabant owners huh?..hehehe That's what a monopoly produces...:-) Anyway...sorry if I was a bit abrupt, I'm actually quite interested in the current state of the Atari, think I might have to look closer into it I think. I have a PC, the way things are these days it's really compulsory at times *groan* but I must say I can't really stand the thing, I try to do everything I can on my Ami or on the Mac emulator I use. I must say, the Mac heads are nearly as fanatical as us and they do get their noses a bit out of joint when they see me running Netscape, Duke 3d etc etc on my humble Amiga..hehehe Still, you're quite right, it is all about choice and I can respect anyone who chooses not to play "Follow the leader" when it comes to their computing platform. Lets face it, it's the Atari , Amiga and Mac users that are the last hold-outs from total M$ domination, so keep up the good work and hopefully we can give Gates and Co something to think about in the coming years..(well, that's the dream anyway!)Oh..for anyone who's interested, the Ami Web Dir URL is http://www.cucug.org/amiga.html

I.C. Well, ehm... a PC keyboard is hotswappable if you don't have the PS/2
(although some are) variety ;-)

Just kidding. Yes you're right, I saw the wrong point. But also, I didn't
get the whole thread (I tried) so I kind of rolled in on this).
USB also allows daisy-chaining and some sort of hubs, doesn't it?

:-) Thanks though.

I am in complete agreement with this post. Dedicated connectors also work just fine and can be made (and often are!) hotswappable. In addition, it reduces possible fault locations because it often can only be plugged into something one way or another. USB is more flexible yes, but do I need it? Not right now, perhaps in the future.

Exactly my point as well. Well, erm USB connectors alone take less space than most conventional ones, but that's about all I can think of. But I really don't care. It just creates another problem for Wintel machines. Or another sales-argumement. Or more work for system and network administrators. More problems? Who knows...

Actually most PC sound cards have 2 joystick ports and
3 MIDI ports. You just have to get the appropriate cabling.

>have to swap them (also, you need drivers for your sound cards gameport).

Not so. Various PC SCSI scanners come with the necessary SCSI
card as part of the package and parallel scanners also have
passthru connections for the printer.

>for your scanner or swap your printer and scanner all the time. Also, on the

Neither is the scanner as of yet. <chuckle>

So? What does one do when one is confronted with a 3rd
USB device? You buy what resembles a $100 4 port kludge
box. So the obvious question is: why not just make a kludge
box that already works with the old peripherals which just
happen to be as PnP as USB has demonstrated itself to be
anyways.

Something was missing: a cheap, hot connecting, PnP interface standard.

> At least they're available. Also, it's rather difficult to
> say whether that cost has any real bearing on the realities
> of cost.

Most new standards take a while to catch on unless they are very compelling.
I, like most people with a fairly new PC, have a USB port on my computer. I
am willing to wager that it contributed almost nothing to the cost of my PC.
USB controllers are simple and shipping in large volumes. I would expect them
to be cheap.

> When considering that they were being connected just fine
> before with lack of muss or fuss, NO. Having seen what can
> happen on a broadcast bus network when stations are mal-
> configured I have no interest in having either any of my
> high speed peripherals or my primary input devices attached

What type of network are you refering too? Ethernet? Are you sure that a mal-
configured station can wreak havok with USB?

> The question remains: just what was broken & why the pressing
> need to replace interfaces and devices that work perfectly well
> as is.

On the PC side, joysticks are normally attached to your sound card. Many
sound cards only have one port so, if you have more than one joystick, you
have to swap them (also, you need drivers for your sound cards gameport).
Very annoying. On the PC, you can only normally have one keyboard attached to
your computer at a time. This is annoying as I like to use a different
keyboard for number entry and for typing and switching keyboards is a pain.
Most new PCs only have a single serial port and tablets are usually connected
through the serial port. So you cannot use a tablet if you need that port.
Most PC printers and scanners are connected through the parallel port. But
most PCs only have one parallet port so you either have to buy a SCSI card
for your scanner or swap your printer and scanner all the time. Also, on the
PC, none of these devices are PnP.

On the Mac side, things are a bit better. ADB allows you to chain up to 15
devices together. But USB is likely to have more and cheaper peripherals, it

is hot connectable, faster and supports more devices.

So, I'll have to disagree with your statement that these devices and interfaces work perfectly well already.

Gravis has still readiliy available an adapter for any sound card that gives
you two analog joystick ports and a genuine 5-pin DIN MIDI IN, OUT and THRU
port on your soundard without additional drivers (or so says the manual).
2nd joystick port uses a different address, usually.
>Very annoying. On the PC, you can only normally have one keyboard >attached

Also, on the PC, none of these devices are PnP.

Seems to me like a PC problem, not an Atari problem. Well, perhaps we should
buy computers that are not a PC, like... wait a minute.. this is
comp.sys.ATARI.advocacy, right? :-))

>On the Mac side, things are a bit better. ADB allows you to chain up to 15
devices together. But USB is likely to have more and cheaper peripherals, it
is hot connectable, faster and supports more devices.

Hmm this all sounds kind of like the old Atari 8-bit computer daisy-chain
serial ports of the 400, 800, XL/XE, etc....
That was universal to, albeit limited to Atari...

>So, I'll have to disagree with your statement that these devices and
>interfaces work perfectly well already.
Do your Atari joystick ports work?
Does your keyboard connector work? (You shouldn't take a PS/2 one)
Does your PS/2 mouse or mouse adapter work?
A PC can havemultiple serial ports. A TT has four.
Does SCSI work for scanners? For printers? For hard drives? Ah yes... Ultra
Wide SCSI huh? That also means 16 daisy-chained devices, doesn't it? Perhaps
even more...

Does your parallel port work? Can you use a printer on it? Can you use a scanner on it? Can you use a storage device on it?

Seems to me there's plenty of choice of working alternatives...

I have worked with computers of all sorts for quite a few years now and
have yet to lay my eyes on a Jaguar, and therefore Myst on an Atari. You do
know the difference between a console and a proper home computer don't
you?.

And if WebTV suck so much (and it does) WTF do you use it?.
Why not use an Atari?
WebTV has zero potential, no matter what platform it is based on.

A well constructed arguement on why the Amiga sucks would have given you
some credibility with your opinion, but as it stands it sounds like
something an illinformed 14 year old would say.

Clockmeister.

Mine only has one and since it is used in all DVD equiped Dells, there are a lot of computers that only have one. But even with 2 ports, you can't have a joystick and two game pads. You need the joystick to play sims and the game pads to play sports games. Of course, you can buy a box that connects to the game port and provides 2 or 4 extra game ports. But then you have a piece of hardware that is just as kludgy as a USB hub and still doesn't solve the problem of having to switch drivers when you want to use a different joystick.

[BTW, you didn't address the keyboard issue]

> Not so. Various PC SCSI scanners come with the necessary SCSI
> card as part of the package and parallel scanners also have

Some do. If you buy a SCSI scanner then you are obviously paying for any bundled SCSI card. And I have seen scanners without pass-trough connections. Also, neither SCSI nor parallel connections provide PnP. SCSI is not a hot pluggable bus.

> Neither is the scanner as of yet. <chuckle>

Bugs in a pre-release version of Windows 98 don't make USB a bad interface.

> box. So the obvious question is: why not just make a kludge
> box that already works with the old peripherals which just
> happen to be as PnP as USB has demonstrated itself to be
> anyways.

Here is why not:

1) Your kludge box will have to offer me 4 ports of the same type unless your kludge box can do some interesting things. What happens if I need 2 extra serial ports, a parallel port and a game port. Can I get that by buying one of your kludge boxes? If so, will you let me exchange kludge boxes when I no longer need the serial port and, instead, want an extra game port?

2) Will your kludge box automatically detect when I plug in new devices and load the appropriate drivers for me?

3) Will the operating system recognize all of my game devices, attached to your kludge box, at the same time ie. can I change from using a joystick to a gamepad without changing any configuration settings?

I another post, you called me a dickwad, and said a lot of people care about the IStapler. If you are saying it shows how stupid certain Mac users, like Peter Sinclair are, then feel free to say that. Anyhow, this is an Atari newsgroup, so what does the IStapler have to do with this newsgroup? Feel free to welcome Peter Sinclair's offsubject posts on here. I assume you enjoy your newsgroup being cluttered with his offsubject stuff.

By the way, I would highly suggest you not go casually saying someone is a moron, particularly, if you are correcting me when I used the word "maroon". I am perfectly aware of the word "moron". Apparently, you are not aware of your Warner Brother cartoons. Rather than call someone a moron, the expression is, "what a maroon". This is where I got it from.

Good day...

That's certainly issue from a pure management and algorithmic
standpoint even if your OS is doing all of it's prerequisites
correctly. It rather sounds like the perfect instance for
reality to come up with variations the developer never thought
of.

I've had good reason to distrust universal automagic PnP
schemes so promises of yet another one that just may work
as well as the last one don't impress me.

As a supplement for those 'power users' it has some merit.
As a basket to put all of one's eggs into, it does not.

Personally, I like that my keyboard and mouse and external
bus each have their own IRQ.

Why does everyone hate intel and microsoft?
Intel makes good equipment and windows makes decent software. Do people hate them because windows sucks? Or because they're just jealous of their success? This has always baffled me. Personally I don't like windows much. I'm getting a mac soon(an older one) so I'm curious what it's like. I grew up on ataris. I used atari 520st extensively as a kid and loved it. I think it's simplicity had a very unique elegance to it that has never been beaten or imitated. It was more "fun" to use than anything else I have played around with, it's a shame the rest of the US and world for that matter, didn't realize this.

Yes, it will. The USB devices can be uniquely identified and their signals forwarded to the appropriate driver. The game port does not have enough information to do this. Also, I am not advocating that everyone replace their existing devices. I think that people should consider buying USB devices when they buy new devices.

> >Some do. If you buy a SCSI scanner then you are obviously paying for any

At work we have an Epson scanner. We bought it in '96. I'm not sure of the model but it doesn't have a pass-through connector.

Actually, I develop SV software for NT. I run Windows 98 at home. Say I attach a new printer to my parallel port. Will the drivers for that device be automatically loaded? No, the won't. So why do you think that parallel devices are PnP?

> >Bugs in a pre-release version of Windows 98 don't make USB a bad interface.
>
> It doesn't demonstrate the value of it over other

You were using a bug in a pre-release version of Windows 98 to desparage USB. A buggy operating system doesn't make an interface standard flawed. If Windows crashed after you installed a SCSI card, would SCSI be flawed?

> Judging by the overwhelming adoption of USB over the period it
> has been bundled with new systems, that sort of need must be
> underwhelming indeed.

As I said before, new standards do take a while to catch on. Even the CD-ROM had a slow initial adoption rate.

> Will your OS do so without a BSOD or other similar PnP
> artifacts that have already been experienced?

Irrelevant unless the flaw lies with the interface and not with the operating system.

> >3) Will the operating system recognize all of my game devices, attached to

> of.

When the OS receives a signal from the game port, it doesn't have any idea what kind of device is sending the signal and, therefore, can't automatically determine which driver to use to process the signal. So the user has to tell that operating system what type of device is sending the signal. On Windows 95/98, you use the "Game Controllers" control panel. With USB, however, the operating system knows exactly what device is sending the signal and can forward the signal to the correct driver without user intervention. That saves you the hassle of going to a control panel every time you change devices.

All the device needs to do is to be able to communicate with
the OS. Even something as old as an HP540C can do that with even
the first release of Win95 quite nicely. It merely the same
level of organization and discipline required for IP port and
PCI ID assignments.

Win98 should have been gold at that point. It was very
likely a release version. Furthermore, it was a staged
PR event. So one should expect the conditions of the test
to be rather ideal. This was not some early QA iteration.

Both are an issue. The concept is as much of an issue as
the implementation is. Abstract design concepts very much
impact real world performance.

Hmm WebTV is actually based on many platforms. Yes it's there on Amiga, it's there on CD-i in the Netherlands the KPN Telecom company now wants to do it on pretty contemptible format and eh.. let's see there was CDTV. At least you could expand it like a decent computer...

WebTV is for someone who's bored with standard consoles and wants a little bit more but doesn't really have the guts to go out into either the real world or true cyberspace, IMHO.

>Clockmeister.
Hey clocky! We AGREE!!!!!!!!! :-) Let's celebrate :)

Hmmm what do we need?
ALL ATARI + COMMODORE + AMIGA + APPLE + ACORN fans in the world, each spending $1 (er wait a minute - that's not enough)
-A common average user entry-level OS that is powerful enough for power-users and easy, stupid, stolen or crashy enough for those people who normally buy PC's so we can get them on our side
-Many many clones and 68K competitors still conforming to that one modular, multithreading, multi-user, multi- & parallel processing OS with built-in connectivity features for a host of networking apps both remote and local
-Win16 & Win32 emulation, Linux emulation, DOS emulation, OS/2 emulation, Mac emulation, MagiC emulation, Kickstart/Workbench emulation MSX emulation, ... (well not completely emulation, sort of native being a modular operating system)
-Common reference to cheap peripherals
-Powerful marketing name & marketeers
errr
did I forget anything?

piece of cake :)

I think the only real enhancement of Falcon-competitors (about equally old) was the AGA. But I'm not qualified to vouch for that. Perhaps Clocky(tm) can give us some clues??

F030 did 8-channel stereo sound at 50kHz well - STE's did 50, Falcons did about 49 - at 16 bit. Now there's aftermarket hardware for the Ataris that had a VME bus and for current clones to match f030's performance or bneat it (24-bit) - card's name doesn't spring to mind yet, have to look it up...

Hmm

There are some controllers that are connectable to a stanard serial port (not just mice)

Of course had you had an Atari falcon or ste you'd have two standard ports, 2 extra ports (expandable to 4) totalling 6 ports then there's the parallel port adapter for even 2 more ports (just like amiga - same adapter i believe) which makes 8, and using paddle in stead of joysticks makes 16. hmm on a jaguar you could daisy-chain'em with the right soft- and hardware wchich would make even more. and even on ataris you can - with the appropriate drivers - attach some devices to the four or so serial ports on a tt.... (tt also has the two expandable ports of the falcon and the ste / mste)

Hmmm or you could use USB?

A Gravis MIDI-adaptor also solves your problem if your joyst8ick port can
have multiple addresses assigned....
gives you three genuine midi ports as well, just by connecting the box :-)
to bad they don't make sound cards anymore :(

Actually, it's a true assertion that can be easily tested. Buy a game port expander and plug a Flightstick and a Gravis Game Pad into it. Without using the "Game Controllers" control panel (or doing it directly in the game if it does direct controller management), neither device will work. And when you switch devices, you much change your settings. With USB, you don't have to do this because the operating system knows what device is sending the signal.

Doesn't the phrase "Plug and Play" imply that you can use the device as soon as it is plugged in? This is not true of parallel devices because you still have to manually load the drivers. With USB, the drivers are automatically loaded.

> Win98 should have been gold at that point. It was very

But even if the release version of Windows 98 has this bug, it wouldn't make USB a flawed interface standard. Just as flawed SCSI handling in Windows 98 wouldn't make SCSI a flawed interface standard.

> Both are an issue. The concept is as much of an issue as

Can you describe some specific aspect of the design that might make for flawed real world performance?

> ...sounds more like your problem is in windows, actually.
> Either way, it seems that you will still have to manually
> tell the OS something.

OK, explain to me how, in any operating system, you could tell what device is sending you signals over the game port? You could not tell unless these signals happened to be unique for each device (which would be a huge fluke) and you had some huge amount of code that could analyse these signals and figure out which device was sending them. USB, OTOH, provices globally unique device identification (like Ethernet cards do) so the operating system can tell what device is sending what signal. It can then forward that information to the appropriate driver for processing. So, you do not have to "manually tell the OS something" with USB.

There's also expense and complexity to consider. While
we may find the entry price to the net with a general
purpose microcomputer acceptable, many do not. A sub
$500 solution that doesn't require a special purpose
(vga/xga) monitor that adds even more cost is just not
that easy to come by these days.

A TV can be a useful price tradeoff for the time being
for those who find that a monitor that you can buy for the
price of a 19" TV to be somewhat unimpressive and an 18"
(actual measure) or larger computer monitor to be an un-
acceptable extra expense.

RAID racks are an entirely different beast altogther.
However they do provide a useful proof of concept.
Many of the sorts of things one could do to create
a nifty new connector can be applied to existing
tech with less impact. There's no reason that the
'PnP' joystick with a USB connector couldn't accomplish
the same thing with an older physical port.

It may be interesting to note that many of the USB
scanners are just slightly modified EPP ones and
still retain their EPP ports.

>
>Maybe I'm just tooooo plain basic :-))

USB is too slow.
Each port needs it's own IRQ.
The star topology is going to cause usability problems.
Something like an iMac needs multiple ports (more than
just 2) to ensure sensible IO management.

The catch with this example is that one does not
know exactly where the problem is. The more intresting
joysticks that require special-purpose drivers should
be more than capapable of identifying themselves. It's
likely all rather driver dependent.

Whatever method you could use over the USB wire would work
similarly over any other, especially if you're going to
have to overhaul that entire subsystems drivers anyways. The
OS can poll devices regardless of the physical configuration

of the wire and devices can similarly broadcast. Although
either of those are potential problems.

Broadcast stations lowering effective thruput drastically
by unnecessarily throwing messages on the bus would be
a good one.

That's what protocols, IDs & special purpose drivers are for.
Those will layer on top of an old set of wires just as well
as they will layer on top of a new one.

>figure out which device was sending them. USB, OTOH, provices globally unique

Yes you do. The user still needs to tell the OS what to
do with those inputs. At this point, while the machine
has an eternity to spend processing user input it can do
a single controlled poll of the bus.

Actually, it's more of a protocol issue. What is the standard way of
identifying devices after start-up? Answer: none because SCSI wasn't designed
with that in mind.

Huh?
1) _WHY_ is USB "better" (and for which purpose specifically?)
2) It would probably suffice to use newer drivers?
>I don't know what you are talking about. I'm claiming that PC parallel
devices
>are not PnP and USB devices are. Do you believe this to be true or false?

False. Some parallel devices _CAN_ be PnP (OS, device and everything
inbetween-dependant).
USB doesn't necessarily need to be plug&play. The OS does not need to make
use of it. It could resort to existing ways of comms over a daisy-chained
setup.

Ever heard of "Ethernet"? Compared to say - Token Ring - there is an
abundance of redundant signals and packets resends, which reduces the
effective usable bandwidth. Then there's the system of using hubs which is
being replaced by switches for a reason (e.g. allocatable bandwidth, which
is IMO nothing more than a patch to reclaim some bandwidth by allocating
more to nodes that actually make use of it). USB also uses hubs (which AFAIK
equally devide the existing bandwidth), which has advantages over
daisy-chaining as well as disadvantages.

All this IMHO and AFAIK ofcourse :-)

You can on Ataris... (well technically). And how old is this established controller port standard? Reaches waaaaaaayyyy back.

By determining which device is suddenly signalling. Think of the automagic
mouse/joystick switches (Roboswitch?) for Ataris 'n Amigas (and other
systems conforming to the Atai controller pinout standard).
But then, it's nothing new really.

> At least with a standard joystick port, all software
> can make decisions based on specific assigned input
> channels. USB doesn't appear to have such things and
> user input will be required for the OS to sort things
> out.

Exactly. It also probably offers better response and less intermediary
dependency upon eachother. So, when your USB printer breaks down or produces
errors (imagine you have one of those devices that you cannot turn off...)
i'd hate to think that it might sever my modem connection, corrupt or deny
any and all input on other devices and ruin my active ISDN TA because
therefore the Flash update fails.
Phew.

2684. CD32 and CDTV

Newsgroup: comp.sys.atari.advocacy

>From my understanding the Jag was a good machine, as were CD32 and CDTV
It is. 64-bit in 1993 :-) Nintendo came in 1996 (in Europe).
VLM :-)

>(when you consider the time in which they were released). It's a pity the
>world wasn't ready for consoles at that time...

The world was ready for Nintendo and Sega. And later on, for CD-I but not
until Philips / Magnavox switched titles from education to full motion video
(CD-video), sex, computer games....

>For instance... Most games that became available for the CD32 were simply
>slightly modified versions of Amiga games available at that time, and most
>of them didn't take advantage of the extra capabilities of the CD32.
>Developers weren't interested it seems, unlike today...
CDTV and CD32 were true Amigas. Just like some Falcon was originally planned
to be (or so I've read).
Reminds me of really old consoles that had computer add-ons for them.

But all-in all, did CD-I make it? Did 3DO make it? IMHO, the CD32 and moreso
the CDTV deserved more attention and support than the former two ever did.
I'd prefer those anytime (except that it'd be nice to have something for
every platform, so if I'd buy an Amiga, it'd be a complete one, if you know
what I mean).

:-)

I know someone who gets to do all existing applications on the Net except perhaps Java, on his 8-bit Atari 800 XL. There's also an abundancy of cheap ST's and Amigas (which do not require a dedicated VGA/XGA VDU - an existing TV will do nicely), and even a PC/XT with a cheap modem will get you on the net. (Use Arachne).

You do not need Pentium stuff for simple browsing and E-mail. I'll bet I can get you on the net with ANY real PC for less than 1/2 the cost of a WebTV, using completely free stuff. Even adapters to get your VGA pic on a TV cost me less than $55 US.

:-)

Actually, you would have channels or whatever packet
switching method that USB is using. Infact, I wouldn't
be surprised if the current port has enough free wires
to carry all the USB signals such that a newer joystick
could be either & not push the buyer in one direction
or the other artificially.

That still doesn't tell the OS what it should do with the
input. The OS will have to make some potentially dangerous
and likely wrong assumptions for your schema to work.

That still leaves how to interpret the input. Is is the left
tank stick or the right? Is it for user 0 or user 7? The only
way your scheme would work reliably is if you restricted it to
those situations where an automated driver on a standard joystick
port would work as well.

One of your critics of USB was that you would have to buy new devices to use it. If you changed the protocol used by game controllers then you would also have to buy new devices because the old ones would not be able to communicate using the new protocol. So, if you are going to replace your devices anyway, why not use a better interface?

Actually, I hadn't heard of this device. It sounds pretty cool but I bet that
it has the following limitations:

1) For generic drives, you have to manually mount the drive
2) If the drivers do device detection at startup then you are out of luck.

I'm not so trusting of my OS or application software.
Nevermind just how is the OS supposed to automagically
deterimine that device Q should now be used in place of
device R's inputs on a bus?

At least with a standard joystick port, all software
can make decisions based on specific assigned input
channels. USB doesn't appear to have such things and
user input will be required for the OS to sort things
out.

That's a driver issue, not an interface issue.

You don't know that. I think that USB is a better interface because it allows you to replace a lot of the low speed interfaces on your computer with a common standard. That way you can add devices that you need without worrying about port availability.

> I certainly don't relish the prospect of nested
> hubs or paying more than the going rate for 100BaseT for them

The price will fall over time as USB becomes more popular. CD-ROMs were expensive to begin with but now they are very cheap.

> The old joysticks conform to a common, set standard, they
> should be easy enough to deal with. In fact, the new special
> protocol joysticks working along the older ones rather demon-
> strate the feasability of this arrangement.

That's the problem: you think that joysticks work fine now and I don't. I don't like making a trip to a control panel every time I switch joysticks because there is no standard protocol for identifying devices.

> Odd that Windows95 has different ideas. Mind you, it likes to
> autodetect my printer mulitple times but it is quite up to the
> immediate task.

Isn't printer autodetection just a guess? There is no standard way of going it, I believe, you just send signals and see what response you get. Then you guess what type of printer it is and ask the user to confirm. None of this uncertainty exists with USB.

> >So, if the Windows 98 implementation of SCSI handling has flawed then you

So you think that if Windows 98 doesn't do it right then it "cant be done right"? That's absurd.

Nope. I asked for a USB specific example. Please provide one or concede that
you are not aware of any USB through-put problems.

Easy. USB devices send their device ID along with the data. That way the
operating system can easily know what device is doing the talking.

> At least with a standard joystick port, all software
> can make decisions based on specific assigned input
> channels. USB doesn't appear to have such things and
> user input will be required for the OS to sort things
> out.

Why? The operating system can get a listing of all the device on the bus and
can then use the ids of these devices to assign drivers to each device. If it
can't find the driver for the device then it can either ask the user to
install the driver software or ignore the device.

Because I don't see any Atari computers let alone Amiga which are internet capable around here and probably wouldn't have the money for one anyways. Therefore I use the $100 webtv. Sorry I didn't have time to construct an argument last time. I don't know that much about Amiga, but what I do know makes it seem as though it sucks when compared to Atari. That is why I made that statement.

Casey Allen Shobe <shobe1knobe@webtv.net> wrote in article
<10115-360E949A-10@newsd-214.iap.bryant.webtv.net>...
FYI, Mr. Amiga, Myst has been available for Atari since the Jaguar CD VGS. Amiga sucks. WebTV sucks, but I use it. If it were based on an Atari platform, it would have greater potential.
I have worked with computers of all sorts for quite a few years now and have yet to lay my eyes on a Jaguar, and therefore Myst on an Atari. You do know the difference between a console and a proper home computer don't you?.
And if WebTV suck so much (and it does) WTF do you use it?. Why not use an Atari?
WebTV has zero potential, no matter what platform it is based on.
A well constructed arguement on why the Amiga sucks would have given you some credibility with your opinion, but as it stands it sounds like something an illinformed 14 year old would say.
Clockmeister.

> 2) It would probably suffice to use newer drivers?

You can't update the firmware in your joystick so any new drivers would have to use the old communication protocols anyways. So you would have to replace your devices. If you are going to replace your devices then you may as well use the better (see above) USB interface.

> False. Some parallel devices _CAN_ be PnP (OS, device and everything
> inbetween-dependant).

But that's the problem. Sure, we can devise a totally solid PnP system on top of a parallel interface. No problem. But, unless our parallel devices have updatable firmware, we need new devices. If you are going to replace your devices then you may as well use the better (see above) USB interface.

Of course :-> But this is not really a weakness unless the effective bandwidth of USB drops below what you need. If you are using USB to replace parallel, serial or game ports then it won't be a problem.

I believe that is because all the joysticks send the same signals. That kind of sucks if you want to give your joystick some interesting behavior that requires new signals.

Why is it a good idea? Why have ports that you don't need and others that you need more of when you can just standardize on one interface?

> That doesn't do one much good now. It doesn't do anything
> to minimize the fact that your 3rd USB device will cost

Good point. But I think that by the time most people get their third USB device, the price will have fallen.

> The problem with this retort is that USB is not required to

But how do I do that without throwing my existing joysticks away? And, if I am going to do that, why not just use USB instead?

> The port is bidirectional, actually, so the printer should be
> more than capable of reliably identifying itself.

I'm talking about existing devices. Not what a device could do with an interface standard. You can't change the way most existing peripherals behave.

> You are misrepresenting EPP.

How so?

> Perhaps you could point to another x86 OS that does it right.
> The relative complexity of PC hardware is as much an issue as
> anything else in this sort of setup.

The fiber channel must be flawed because no x86 OS handles it correctly.

> You didn't mention USB in your demand actually.
> If you can demonstrate why ethernet is a bad
> comparison we're all ears.

I said "Please provide a specific example, that you know can happen on USB, which "drastically" reduces through-put." And the need to demonstrate is not in my court. You made a claim, you need to defend it. I do not have to prove a negative.

> That's what the driver for, just like an 8 port or
> more serial card.

So the driver knows about every possible device so it can tell which one it is talking to?

> That still doesn't tell the OS what it should do with the
> input. The OS will have to make some potentially dangerous
> and likely wrong assumptions for your schema to work.

I understand now and I don't share your concern. The Mac has worked this way for years and I don't recall it having been a problem. If you press the 'G' key, it doesn't matter what keyboard you pressed. If you are playing a game then may have to configure each joystick separately if they don't share common button configurations. But, unlike the game port, once you configure a joystick, you don't have to tell the operating system which one you want to use. It will figure out that you want to use it when you actually do use it.

> That still leaves how to interpret the input. Is is the left
> tank stick or the right? Is it for user 0 or user 7? The only

> those situations where an automated driver on a standard joystick
> port would work as well.

See the above. Remember that this situation has existed for years with ADB. Has anyone told you that they found this to be a problem?

Faster compared to what?
Existing interfaces on PC's have ALL been standardized
Small I agree upon (as stated earlier)
Parallel ports can be hot-pluggable (try external CD-RW with UDF standard)
>interface is small, etc. Really, except for the (short-term) high cost of
>hubs, what is bad about it?

It's yet another new standard and yet another incentive to buy more, newer
hardware. Yes it has some improvements, but about as much as AGP has over
PCI. Ofcourse one is better than te other, but is the relative cost of this
really justifiable? HOW MUCH better is it?

My CD-RW (parallel) _has_ updatable firmware. So do some laserjets (but why
do that if you can simply take the roms out and put new ones in it?)

Which is not impossible. You could make hardware adaptors that provide these
new signals. Have you heard of some arcade joysticks on Atari? Amiga, MSX,
7800, and other Ataris all have the same joystick standards yet some provide
different features on joysticks than others. MSX and 7800 provide multiple
firebuttons without special hardware on the joysticks or ports to seperately
utilize, the ST's only use one because the other can be used as an extra
mouse button and on the Amiga you can connect analog joysticks to the same
ports.

This is the same answer as "why use AGP" would give: "because it can use
your PC's memory as well as dedicated memory which allows for more complex
graphics" (without stating that this sometimes may severely impact the rest
of your PC's performance. And multiplexed multitasking hasn't been really
one of the PC's true strengths anyway...)

You only need new devices if you want the new features.
If you don't want the new features you don't have to
worry about your options drying up. ST/TT users should really
be pissed about this sort of thing as these ancient standard
ports have constituted what support has been left for the
line.

Ever seen the number of unused wires on a serial or parallel
interface or an svga one for that matter. That's likely why
the interface is now a PnP one with no ill effects done to
legacy hardware.

If you like the simplicity of STs, you'll love Macs, since the STs
were, and still are (more than ever) a poor man's Mac!
People hate the Intel/Microsoft duo simply because they became what
they are today not because of their inherent qualities, but through dirty
business tactics. Ask yourself why Microsoft is sued every month, and
Intel too, but on a less frequent basis.
Get a Mac, you'll see it's still "fun" to use a computer.

Old, used Macs cost peanuts, and can be setup for the Net easily.
Much more user-friendly than Arachne running on an old PC.

Yes, it had to be easier, not to plug and use, but to FIND
peripherals. Ever tried to find a wireless ADB keyboard? One was released
a couple of months ago. None was available before that. Now, with USB,
things are different. There were USB keyboards out there even before the
iMac, and many more will come after its launch. Same for mice, joystick,
etc. I believe that you, as an ATARI user, can relate to this. It's kinda
hard to find peripherals once you use proprietary technology. Apple, by
adopting USB, made it easier for its users to find stuff for their Macs,
without compromising quality and actual ease of use, because, AFAIK, USB
is just as good, if not better, than ADB.
USB is slower than what? What are the other available options? The
standard serial/parallel ports of today (no, of the past, these are real
old technology) have maxed out its capacity long ago. USB came to replace
those. If you're thinking about using USB for HDs and things like that,

it'll be slow, because USB wasn't meant for that. Use Firewire instead.

>
> Actually, USB looks remarkably like the past, a past that
> many of us were glad to see gone.

You're delusional. I understand ATARI users like to stick their head
firmly in the past, but this is beyond comprehension. Man, my stupid ATARI
needs a hack to make its serial port go beyond 19200. Is that good
technology? I don't think so.
USB is the future, a future I'm glad to see Apple is moving towards to.

USB is hot-swapable indeed.
I know USB is better than ADB at PnP. That's why I actually _LIKE_
USB :) I don't know what impression you got of my previous post.

Whoa.. Good :) Now tell this to all the ATARI bigots out there :)
Maybe they're jealous they don't have USB interfaces yet :P

So I take it you like having different connectors for each thing? A mouse port, a joystick port, etc. Wouldn't it be easier to have an universal connector, so _ALL_ computers (PCs, Macs, even ATARIs) could use the same devices?

> The question remains: just what was broken & why the pressing

> as is.

It is broken indeed. Serial ports have limits now, same as parallel ports. They're kludgy. It's time to move forward, to unify the ports. USB came to do that, and I hope it succeds!

The past I think he is referring to is the old 8-Bit Atari's, and how they
daisy-chained by serial connection, -which- does remind one of USB quite a
bit. (in fact, IIRC, it even offers a few advantages) ;-)

Capiche? ;-)

What "catch1" said was that all big-box Amiga's came with CD quality sound.
I stand by my original reply. He was wrong. The Falcon however, does have
CD quality sound from the box, day 1, whatever...no expensive add-ons are
required. ;-)

Clarify the 14-Bit spec for me-to achieve that, Amiga's have to split
the original channels/lower the frequency? Is that right? Also, does
it require more processor time/faster CPU than a standard 68k Amiga?
(or the A1200?) Thanks in advance for the info.

Goodie: now you can make your iMac look just like
an Atari 800 with it's interface port hub.

Sorry, but Expensive Octopi just don't impress me.

USB doesn't adequately address those limits and
imposes some of it's own. Furthermore, those
limits are being actively misrepresented.

Decentralized IO for PC's has some interesting potential.
However, the directions I see USB going in don't seem to
indicate that USB will achieve any of that. Furthemore,
this crop of USB advocates seem to view it as an excuse
to make life as difficult as possible for users who
see little promise in USB and/or are perfectly content with
their older interfaces.

Message-ID: <15957-3613FD07-30@newsd-211.iap.bryant.webtv.net>
Source record: 4329

I was reading some of my early posts in here and really surpised myself. I must have been in an excessively bad mood. I don't normall call people names, let alone the ones I was using.

Fist off, I'll straighten out that reply to the iStapler post. I thought that the site was very funny and showed how stupid Apple's new design was (IMHO). And at the time, I thought that Sinclair was actually a decent Atari user like the rest of us (well, most of us, anyway).

As for my involvement in the Atari vs. Amiga war, I personally love Ataris very much and saw some of the postings by Amiga supporters very insulting, and therefore responded in an equally insulting manner. However, I grew up with a Commodore - it was the first computer I ever had/used. The Atari 2600 was my first game system, which I had first. Now recently, I have begun collecting Atari stuff and have about 150 2600 carts. I also purchased a new C64 and an Atari 800XL. I happen to think that the Atari unit is a nicer system. Now if anyone can tell me how to get internet access on my Commodore 64 or 128, I would be VERY GRATEFUL. What about the Atari XEGS? I've heard there was a modem for it as well.

Everything I say on here is IMO, I do not pretend to base all of my statements on solid facts, because there is a lot about both Amiga and Atari that I do not know, although I do know more about Atari.

So, let the newsgroup go on! Sorry for all of my babbling.

-Casey

2719. Re: JAVA for CAB? Parallel PnP

I just wanted to bring up this point. I purchased an Epson Stylus Pro early last year and as soon as I plugged it into the back of the computer (power was already on), Windows 95 recognized it's presence and asked for a driver disk for the device "Epson Stylus Pro". Now how could it have done this if parellel ports are not PnP?

Group: comp.sys.atari.advocacy Date: Tue, Sep 29, 1998, 9:47pm (EDT+4)

In article <slrn7122rq.93i.jedi@dementia.mishnet>, jedi@dementia.mishnet () wrote:
Yes, it will. The USB devices can be uniquely identified and their signals forwarded to the appropriate driver. The game port does not have enough information to do this. Also, I am not advocating that everyone replace their
Considering what can be done with
current joysticks, that's dubious assertion.
Actually, it's a true assertion that can be easily tested. Buy a game port expander and plug a Flightstick and a Gravis Game Pad into it. Without using the "Game Controllers" control panel (or doing it directly in the game if it does direct controller management), neither device will work. And when you switch devices, you much change your settings. With USB, you don't have to do this because the operating system knows what device is sending the signal.
Actually, I develop SV software for NT. I run Windows 98 at home. Say I attach a new printer to my parallel port. Will the drivers for that device be automatically loaded? No, the won't. So why do you think that parallel
devices are PnP?
All the device needs to do is to be
able to communicate with the OS. Even something as old as an
HP540C can do that with even the first release of Win95
quite nicely. It merely the same level of organization and
discipline required for IP port and PCI ID assignments.
Doesn't the phrase "Plug and Play" imply that you can use the device as soon as it is plugged in? This is not true of parallel devices because you still have to manually load the drivers. With USB, the drivers are automatically loaded.
Win98 should have been gold at that
point. It was very likely a release version. Furthermore, it
was a staged PR event. So one should expect the conditions
of the test to be rather ideal. This was not some early QA
iteration.
But even if the release version of Windows 98 has this bug, it wouldn't make USB a flawed interface standard. Just as flawed SCSI handling in

Windows 98 wouldn't make SCSI a flawed interface standard.
Both are an issue. The concept is as
much of an issue as the implementation is. Abstract design
concepts very much impact real world performance.
Can you describe some specific aspect of the design that might make for
flawed real world performance?
...sounds more like your problem is
in windows, actually. Either way, it seems that you will
still have to manually tell the OS something.
OK, explain to me how, in any operating system, you could tell what
device is sending you signals over the game port? You could not tell
unless these signals happened to be unique for each device (which would
be a huge fluke) and you had some huge amount of code that could analyse
these signals and figure out which device was sending them. USB, OTOH,
provices globally unique device identification (like Ethernet cards do)
so the operating system can tell what device is sending what signal. It
can then forward that information to the appropriate driver for
processing. So, you do not have to "manually tell the OS something" with
USB.

I can't believe I"m bothering to comment on this post (below). I've already apologized for my actions as I was in a terrbibly bad mood at the time, so if you cannot accept that and continue to act in a demeaning way towards me, then that is your choice, but be prepared to promptly be ignored by me.

Anyway, as for the Myst on Jaguar comment I made, I was only pointing out your error in the statement you made that Myst was never released on any Atari platform. I am quite aware of the difference between a computer system and a game system, but they are both types of Atari platforms.

I am also quite aware of WebTVs limitations. However I do not suck simply because I cannot afford anything better at the present time. I may not be as old as you, then again I may be older. However I have AT LEAST as much experience as you do with computers, albeit on other platforms, as after the C64 era, I moved on to DOS and then Windows and have done most of my work on those. I personally like the Intel architecture, and also Windows 98. I have never had any unforseen problems with 95/98, so I must be blessed by Bill Gates, hehe... I have been programming BASIC and Pascal since DOS 3, ran a BBS for several years before Windows came along and the Internet took away all of my callers in a remarkably short time. So now, I am back into Atari/Commodore systems, and if you can tell me how to get the internet running on one of them, I will gladly introduce my WebTV to the Classifieds or perhaps eBay. Until then, it suits my Internet needs.

I've been reading this thread, and all of you forgot something:
daisy chaining. You don't need a hub, unless you have a truckload of
stuff. Most devices will have passthru conectors (of course, mice and
joystick won't!). But still, I'd rather have everything flowing thru 2 USB
connectors on my machine than thru several cables sticking out of several
different connectors.

No, not true. PC joysticks won't work on your ST, and vice-versa.
Same for mice. Isn't it a pain having to track down ST mice, just because
it's some stupid proprietary format? How about the stupid monitor
connector too? I wish people knew what "standard" means back in the 80s.

All Atari intellectual property is owned by Hasbro Interactive. This includes copyrights, patents and software. The problem is they probably don't even know what TOS is, let alone that they own the thing. All they wanted was Asteroids.

Something that forces you to change all your hardware just because your
next PC will not be able have the right interfaces can hardly be
described as cheap.

This is what annoys me the most with PCs. Everything is supposed to be
standard, so that everything is simple and cheap. The problem is that
every 2 or 3 years they change the standards so that all your previous
stuff becomes obsolete. This goes for memory, but also for sound cards,
graphic cards, hard drives, mice, keyboards, etc...

When you buy a new PC now, you have to trash the keyboard/mouse (no more
DIN connector), your sound card (sorry, ISA is obsolete), extra memory
(what? you still using EDO ?), PSU (yeah, we're designing a new
stadard), printer (USB is great isn't it), modem (why add the cost of a
serial port, guys ?)...

Please don't say it's cheaper.

Actually, you could hardly call the serial mouse an intelligent
standard. It has become a standard because of PCs, but is pretty stupid
to a serial connection to run something as trivial as a mouse IMO. In

the 80s, there was no standard, so you had to develop a proprietary
interface to meet your needs. The ST monitor connection was also pretty
intelligent, as it automatically detected what type of monitor was on
the other end and booted up accordingly. The Falcon did the same.

A serial connection is definitely stupid for a mouse! You have to use
complicated electronics to convert the X-Y pulses into 8 bit serial data
that is then transferred over to the computer, who's driver is always
listening to the port, using up precious CPU cycles to decode the
incoming 8 bit serial data into X-Y pulses. That is a stupid standard if
you ask me.

Cheers,
Nick

Dan Cox wrote:

>

> Why does everyone hate intel and microsoft?

IMHO people do not hate them as I or MS, but the way we are forced to believe that these are the only options we have. People need to have alternatives from which to choose, so if someone tells me to use Windoze because I have to, I don't like this.
When the computer press talks about "computers" they usually mean Wintel. Any other alternatives are considered herecy. We are pushed to think that any other systems are useless, and this has led to a situation where this starts to be true. If you want a job with "computers" the basic requirements are knowledge of Intel compatible PC:s and MS software. No matter how good you are producing material with your A-group computers, if you are not familiar with Wintel, you are useless. The results are not what counts, but the means to do it. At home you can use what you like, but at work you are doomed... So I believe this is the reason for slamming the Big Ones.

> Intel makes good equipment

Good, not excellent.

> and windows makes decent software.

Windows makes your head ache :)
MS makes decent software, not excellent. The thing that bothers me is that MS employs hundreds(?) of people to write their programs, but they are still buggy and delayed by months, not to talk about the size they take. On the Atari side, look at Calamus, Papyrus etc. A handful of people have produced these in a very short time, they have all the

features you need and still take only a Meg or two from your HD. How
come? When you run a monopoly, nobody claims. Or if they do, so what.
"You have to use our products. There are no other. Repeat after me a
thousand times: There are no other." Look at Apple's 1984 commercial. Is
it too late for something similar?

> Do people hate them because windows sucks? Or because they're just jealous of their
> success?

These are also some of the reasons, I guess.

> This has always baffled me. Personally I don't like windows much.

There are plenty of Ataris and Amigas online...

Therefore I use the $100 webtv. Sorry I didn't have time
> to construct an argument last time. I don't know that much about Amiga,
> but what I do know makes it seem as though it sucks when compared to
> Atari. That is why I made that statement.

Seems to me your not qualified enough to make a statement like that, once
again, you provided no reasoning behind your statement.

If you don't know, don't judge...

Yes, it does require a better processor AFAIK to achieve 14 bit sound
reproduction. It is possible on 68000 machines but the results are not
good.
On faster Amigas the sound quality is reported to be almost
indistinguishable from PC 16 bit sound quality, so at a guess the frequency
response must remain fairly consistent with 8 bit sound. MP3 can be played
back this way also (with a fast enough CPU).

I'm no expert in this field, so I'd suggest you try C.S.amiga.hardware,
they will be able to give you full details, and correct any mistakes I may
have made.

Sorry I can't be more specific :-(

I read a post in one of these threads that mentioned a hack that will allow this. I would like to be able to use a faster modem, so any help on this matter would be greatly appreciated.

You are speculating. I can't think of any PC, being sold right now, that has a USB port but not parallel and serial ports. Do you remember the transition from 5.25 to 3.5 floppies? First PCs came only with the former, then both and then, years later, only with the later.

> (what? you still using EDO ?), PSU (yeah, we're designing a new
> stadard), printer (USB is great isn't it), modem (why add the cost of a
> serial port, guys ?)...

Even two year old memory could cripple you new system's performance. You can still use ISA sound cards if you want. The are much less capable than PCI cards (which cost under $100) but there is nothing stoping you from using them. You can still use PCI graphics cards if you want. Using anything worse than that would cripple the performance of your new system. I have never seen a destop PC that didn't have both a serial and a parallel port.

> Please don't say it's cheaper.

Look, has anyone actually taken away the serial, parallel and game connectors and their computers? If not then what is the problem?

Without a truckload of stuff or vendor-lock there's
little point in USB besides making the back of an iMac
look pretty.

Just plug the mouse into an extra serial port if you have one.
The monitor issue was solved a long time ago. Everything else
(keyboard,disks,CD's, scanner,printer,modem, cable modem) I
could plug into any Atari with the appropriate ports. In fact,
I think my PC's floppy drive is the last working remnant of my
last STe.

It might be useful for a single device. However, for muliple
devices, effective bandwidth per device will very likely fall
to below where it would have been for a dedicated port. USB
is barely faster than a current EPP port.

Serial and parallel ports are fine for what they are supposed to do. I use a
serial port for connecting my modem, which works just fine (although mine
would need a buffer), and my friend runs a BBS as well as a network over his
parallell and serial ports.
Besides, the Mac has never had standard Centronics parallell ports, which
certainly didn't help+ compatibility, interoperability and speed when
connecting them to other micros and printers.

Rather an example of dated technology. What kind of hack would the Mac require
in order to utilise its inexistant parallell port?

> USB is the future, a future I'm glad to see Apple is moving towards to.

It seems like a lot of unnecessary hot air to me. It is novel in some ways, of
course, but is also very limited ATM, and I'm not so sure about its future.
The computer world offers so many futures each month, you get a bit blas�

after a while.

Of course. So let's make them faster, but why replace the existing, tried and
tested RS-232 standard, for which droves of devices have been produced for two
decades, with something new, for which next to nothing exists in comparison.

>>>

>out there soon.
```

Parallell printers are all over the place now. In fact, one of them sits above
my computer.
The USB peripheral market is very small in comparison to industry-standard PC
interfaces.

>>>Also, USB is meant to connect keyboards, mice, joysticks, tablets,
>>>gamepads, etc. You don't think that USB is appropriate for these devices?
>>
>> When considering that they were being connected just fine

>mouse port, a joystick port, etc. Wouldn't it be easier to have an
>universal connector, so _ALL_ computers (PCs, Macs, even ATARIs) could use
>the same devices?

I already have these ports and they all work, so why repair something which
isn't broken?
On the back of my computer I have:
* Non-standard PSU connector
* Standard coaxial RF output
* Standard RCA composite video output
* Non-standard DIN-23 monitor output, optional standard DIN-15 adaptor
* Standard stereo RCA audio output
* Standard DIN-25 Centronics parallell port
* Standard DIN-25 RS-232 serial port
* Standard Kempston DIN-9 joystick port
* Standard Kempston DIN-9 joystick port/non-standard mouse port

These all work, and have a wealth of peripherals available, so why would I
switch to USB, whose peripheral range is so limited?

Besides, why should I bet all my money on one horse? If my USB bus breaks
down, I will not be able to use my mouse, keyboard, printer, modem or
joysticks, whereas one burnt chip in my current system will probably only
result in losing one or two ports, making the computer accessible despite
failing ports.

Besides, how can PCs, Macs and Ataris share a common port and peripherals,
when USB is only available for a few PC and Mac models, and no Ataris?
Besides, since most of the PC, Atari and Amiga ports are fairly standardised,
the compatibility problems do usually boil down to lack of drivers and
software support, not incompatible ports.

>> The question remains: just what was broken & why the pressing
>> need to replace interfaces and devices that work perfectly well
>> as is.

>came to do that, and I hope it succeds!

Serial ports and parallell ports can be made faster, I have myself thought of
buying a new serial/parallel interface, permitting speeds up to 460 kbps.

I would have to disagree with that. I just purchased a new Compaq
PII450MMX as a replacement mailbox for our outdated Macs at work. My
first experience with using old hardware on this machine was pretty
dismal. I backed up a couple of hundered megs of data onto a couple of
EZ135 carts (SCSI) using an Adaptec ISA SCSI controller and an old
386. Easy enough I thougt. Slap the ISA card into the P2 and in no
time have the data on the new 12gig IDE drive. Right.... An Atari 800
could transfer the data by floppy faster. Estimated time to copy one
disk over was about six hours. I never let it finish. Hey, the
hardware isn't that old, and worked pretty damn good on machines like
a DX2 or P90. I guess the problem lays in the "old way" of doing
thing as far as disk format goes.

Hey, I don't want to screw around with the "fix to this problem crap".
I just ordered an Ultra SCSI PCI card. Just for a simple file
transfer. Hurray for progress and Windoez 98.

And USB will suck in the future as well as now.
It's not the change I fear. It's what they will make me pay for it.

If by older he means an 030 or 040, I think he will be very unhappy
with his purchase (or gift). Older Mac software and O/S 7.5 work
decent on a 40Mhz 040, but try running Bryce 2, PowerGoo or Premiere
4.X on the same machine. He will loose interest as fast as people
loose interest in what you have to say here.
It's spelled sl(O(10^36)w.

Besides, if he leaves his head in his ass and then opens his eyes,
he'll see Peter making his way out for a post.

This seems like a driver problem not a hardware problem.

You are going to order a SCSI card instead of waiting six hours for a
transfer? That doesn't seem very efficient.

You would think that, except the Adaptec logs the removable without
drivers. It uses firmware....... I think that is where the slowdown
is. Win 98 or the PII doesn't handle it properly for whatever reason.

Tru www.emulators.com There's Janus, Gemulator, StonX for serious stuff as
well as Pacifist which is excellent for games. You'll either need some ROM
images or a disk based alternative operating system, like MagiC, to be able
to use them though.If all you need is play ST games, why not pick up an old
1040 STE for around $30-60 or so....

I believe ALL of the rights that Atari had to these operating systems have
been sold to www.milan-computer.de
If you see GEM (the GUI) as part of TOS, it's an early version of GEM by
Digital Research (in turn bought by Novell, and I believe the PC OS division
again by Caldera (Open DOS, new DR-DOS - see www.caldera.com) originally
developed for an Intel-based PC architecture for use with a largely MS-DOS
or CP/M compatible disk operating system (GEMDOS on Atari).

The latest version of the revamped, reprogrammed and really total new
operating system TOS in development is rumoured to be TOS 5, and they are
accepting suggestions for TOS 6 (which supposedly integrates MultiTOS/MiNT
with single-tasking TOS in ROM).

That's all I know... :_)

No no no. Before the takeover from JTS's "Atari Division" by Hasbro, Milan-Computer bought all the rights to the operating system side of things for STE's and such. This means development for this platform is safe for now (besides, you could always opt for MagiC).

Hasbro is a real problem though. Battlesphere for Jaguar is finished for released but they cannot release it on Cart now because Hasbro seems to have lost the encryption key!!! (Seems to me all they're interested in is brand name...)

How could it be a problem with the PII? The PII is just a microprocessor. And,
if the problem lies with Win 98 (which it probably does), then this problem
does not relate well to our discussion.

You didn't mention that you needed to use the card more than once in your
original post. You said that you wanted to do "a simple file transfer." Not,
it seems, you may want to use the SCSI card again. So, unlike the implication
in your first post, you do want a better card and you don't care about the
money.

Exactly. I understand an "old" Mac is one with a 030 or 040 inside (there really were Macs before G3, ever heard of them, Peter?). Running system 7 or above in a MacII, for example, isn't fun anymore, whereas system 6 in the same machine is a joy. All the possible programs were available for this combination at their time, and were (and still are) a good example of what computing should be. Just how well do the present day programs run in a MacII/System 6 combination? Mac+/System 5? Like watching the paint dry? Besides, the CD's do not fit in the small hole in front of a Mac+ unless you cut some parts off with scissors, which in turn results in loss of data in the end of the disc :-)

Regards to Minnesota. No hurry back.

I'm not sure about this. The agreement between Hasbro and JTS mentioned
all Atari's products, including ST and Falcon stuff.

It is true that Milan have bought something from JTS before the merger,
but AFAIK it was only a license to allow further development of TOS.
Technically, the rights still belong to Hasbro, so they would be free to
licence it to someone else.

Neither Hasbro, JTS or Milan have given full details of what they have
or haven't got, so it's difficult to be sure.

Yes, and that is why Atari always refused to release TOS rights, because
some parts of TOS didn't belong to them.

Actually, the Milan is shipped with a version called TOS 4.5, which is
in ROM and monotasking, and Milan MultiOS (not Multi_T_OS), which is
basically MiNT with modified versions of N.AES and Thing.

They are accepting suggestions for TOS 5.0 at the moment.

Check out their web site at http://www.milan-computer.de

If you don't plan to cut the cost of the "legacy ports" as you call
them, then how does adding an extra port make things cheaper ?

Beleive me, the plan is to have USB replace parallel and serial ports.

>
> Even two year old memory could cripple you new system's performance. You can

Next year you won't. Besides, there is no improvement in PCI cards
compared to ISA as far as sound cards are concerned. sound data is not
as bandwidth consuming as video.

> cards (which cost under $100) but there is nothing stoping you from using

Hi Brian...

Hmm...I'm trying to figure out where it says that "a simple file transfer"
also mean "1 time only". Only very rarely have I ever performed any kind
of computing task that I didn't do it again sooner or later. (and some
times, *many* times!) <grin>

Catch ya later... ;-)

I'm sure that you are right. In a few years, most PCs will probably not have parallel or serial ports. But that will probably be years down the road. I remind you of the history of 5.25 and 3.5 floppies.

> Next year you won't. Besides, there is no improvement in PCI cards
> compared to ISA as far as sound cards are concerned. sound data is not
> as bandwidth consuming as video.

Good sound cards do require a fair bit of bandwidth. My sound card, for example, can mix 8 channels, do HRTF for those channels, play MIDI and record simultaneously. Just mixing the channels can cost 843K/s.

> That's what they said for keyboard connectors and SIMM sockets. Hehe!
> Wait until next year.

SIMM chips were removed because they are useless on a fast machine. They provide half the performance of DIMMs and require greater control logic from the motherboard. Do you really want to use SIPs an your PII-450? And keyboard connectors didn't change overnight.

Wouldn't the correct grammer be "...simple file transfers" if you expect to do
it more than once? I thought that, since you used a singular, you just wanted
to move your data over to your new machine.

: MS makes decent software, not excellent. The thing that bothers me is
: that MS employs hundreds(?) of people to write their programs, but they
: are still buggy and delayed by months, not to talk about the size they
: take. On the Atari side, look at Calamus, Papyrus etc. A handful of
: people have produced these in a very short time, they have all the
: features you need and still take only a Meg or two from your HD. How
: come? When you run a monopoly, nobody claims. Or if they do, so what.
: "You have to use our products. There are no other. Repeat after me a
: thousand times: There are no other." Look at Apple's 1984 commercial. Is
: it too late for something similar?

The problem is not necessarily the monopoly issue (but I do agree with you on the marketing issue). There is no true alternative to MS Office in the windows 95/98 market by other big software companies, that run more stable or take less memory. Did you try the other office, word processor packages, like Corel Office and the Wordperfect 8? No real advantage to MS Word.

IMO the difference in quality is due to the diiferent programming approach. In a big company, there are employees working on the software, coming in at 8, leaving at five, leaving the company, entering the company. I guess that not only there are more programmers working on the apps, but also that the programmers always change and new programmers need to get through the sources the employees before them have done. On the Atari the programmer can be almost identified with his programm. But then again, what happens if that programmer dies?

Another point is that in the PC market there is a sickness called "feature virus", that forces the companies to release software as quickly as possible and with as many features as possible- just because of the way the magazines test and compare software (by checklists).

: > played around with, it's a shame the rest of the US and world for that
: > matter, didn't realize this.

In Europe it was quite successful, especially in Germany. But it is the US market that counts.

Alfred

Hey Brian...

I would never read a statement that says "...simple file transfer" to mean
that it would only be performed once, and never again. Thats quite a bit of
a stretch, for an assumption. In fact, in a later message he actually said
that he would probably do it again (might). ;-)

PS This is just semantics though, and I am
bored, so lets talk about something else! ;-)

Then read more carefully :-) I did mention daisy-chaining, albeit as an example of what the old 8-bit Atari home computers had... they could daisy-chain too you know. The question is: do we want this, and why. What are the possible consequences of it? I prefer a hub or switch to daisy-chains almost anytime (except maybe when there's not much space or you want to avoid to many different cables). What if you break the chain or the chain gets broken? How well will the other devices react to that? Until I see some USB in practice I'm not willing to bet on it just yet. It has to be field tested by regular users.

This is all, ofcourse, IMHO.

2769. USB

<<snip>>
>
> No? What would you use? Existing serial ports go no further than
115k.

This is completely untrue. Only ports based on the 16650 or 16550 UART stop
at 115.200 bps.
These are the interfaces that usually get to be used in bog standard PC's,
not high-end
systems.

I can order indusrty-strength standard serial ports of 230.400 or even
4Mbit/second for my clients
any time a day. They all have in common that they work in bog-standard ISA
too.

So are these an awful lot more expensive? No they're not. Why not use them
(and they ARE standardized).?
Because the more stupid you can keep people, the less questions they ask and
the more selling
points you'll have for your "new" stuff. I've heard that an old 8-bit PBI of
the old 8-bit Ataris could do
115k2 as well.... (but I know not enough of it to confirm this).
<<snip>>
>> You have an interesting idea of 'all over the place'.
>>
>
> No, you do. When USB printers are widely available in _BRAZIL_
>(where I live), it probably means it's REALLY all over the place, and mind
>you, just saw an ad for those new EPSON USB printers on the paper today.

Epson Stylus printers offer both parallel and MAC-compatible
RS-422/423/AppleTalk
compatible serial connections as standard. Why use dedicated USB if they
already support
both parallel and serial as standard? In addition, you can get extra
buffered parallel ports
for the Epsons, as well as networking cards (Ethernet 10Mbit, TokenRing
16Mbit, etc.)
and other serial interfaces. And don't forget IR-ports. These are available
in a 4Mbit/s
standard, if I remember correctly. So it would not be so hard, should USB
really be a
markete success, to retrofit any and all existing hardware with USB...
>

> No, not true. PC joysticks won't work on your ST, and vice-versa.
>Same for mice. Isn't it a pain having to track down ST mice, just because

I remember that I saw an ad for a serial port mousedriver ina German mag once. So you can
use serial devices on an ST.

>it's some stupid proprietary format? How about the stupid monitor
>connector too? I wish people knew what "standard" means back in the 80s.
Well, as a matter of fact, altough very rare, the Atari pin-outs do conform to the
DIN standard (DIN = Deutsche IndustrieNorm) that has been popular throughout Europe.
Standard MIDI = 5 pin DIN. Standard keyboard = 5 pin DIN. PS/2 connectors = mini-DIN.
For a long time (long before RCA jacks), 5-pin DIN connectors were even used for speakers
and other stuff. The funny 15-pin? PC-joystick connectors are only standard on PC's. But then
again, PC's are the standard of today.

But the Atari-joystick pinouts were widely accepted for years by all rival brands and competitors
as standard. From MSX, to Amiga (see specs of Amiga Lorraine project on www.atari.nu) to
8-bit, 16-bit and 32-bit systems of Atari and other vendors, they all conformed to that standard.
This meant that you could usually easily connect joysticks for one system to an otherwise completely incompatible
system, altough the pinouts may have been interpreted differently or, more precisely the signals coming
from it. This is why on MSX systems some "arcade turbo" type joysticks have to seperately programmable
fire buttons (just like Atari 7800), whereas on say ST's, both buttons did the same thing (one signal).

<<snip>>
>> USB doesn't adequately address those limits and
>> imposes some of it's own. Furthermore, those
>> limits are being actively misrepresented.
>
>
> What? You mean USB is not adequate for serial connections, like,
>modems? How so?
He didn't say that did he, "not adeqyate for serial connections". USB is a serial standard, so ofcourse it is
DESIGNED for serial connections. That does not necessarily mean that it is also the right standard for other
types of connections.

As for an explanation of "misrepresented": you yourself stated that current serial connections or ports are limited to 115k2. Perhaps the most commonly

used, yes, but faster ports, including 230k4 and 4Mbit as well as multi-port breadboards are readily available - if you know where to look. I have a US-Robotics I-modem. Its standard 25-pin serial port can cope with 230k4, provided that the terminal or computer you use it with provides its signals at such a rate (see first few lines of my reply). How do you think servers with multiple TA's and modems connected to them operate? Do you think there is a maximum of four serial connectors because usually, in case of PC's, only COM1 through COM4, or if you 're lucky, 1 through 8 are supported by the BIOS of your machine?? This is totally misunderstood. There are many comms solutions available for this ranging from 30 extra ports to over a thousand, using simple RJ-11 phone wiring or other standardized methods.

> Tell me some of those limits then... I can't seem to remember any...

I thought you'd read the whole thread? Including mine? There are limits to hubs and
daisy-chaining, USB too has a speed limit, etc, etc. The rest someone else will
probably post here.

Keep the discussion alive :-))

2770. Joysticks

Newsgroup: comp.sys.atari.advocacy

<<snip>>
>No, not true. PC joysticks won't work on your ST, and vice-versa.

There have been some adapters for PC's that enable you to use standardized digital 9-pin Atari joysticks. Also, remember Ataris own PC's?
They used Atari mice, just with different driver software. Saved you an extra
COM port.

>Same for mice. Isn't it a pain having to track down ST mice, just because

See other reply.
>it's some stupid proprietary format? How about the stupid monitor
>connector too? I wish people knew what "standard" means back in the 80s.
It's not impossible to modify and hook-up a VGA monitor. I've seen many people with VGA
VDU's hooked up their ST's WITHOUT having any special video cards, just an interface
adapter...

This is far more true for the PC world. CGA TTL-level pinouts, EGA pinouts, proprietary VDU pin-outs, ECL, and then there was VGA. At first just like EGA which
got people confused because they used the same connectors but one was digital,
the other analog, which resulted in many a damaged or destroyed VDU or graphics card...
Not to mention composite stuff...

I think that in those days, one proprietary standard for Atari systems or for Macs (which it still
is I believe, or do they use standard RGB-seperated BNC??) or for Amigas made things
easier for those people. Ofcourse, VDU manufacturers didn't make much of a problem of it.
Philips made quite a few VDU's that could be connected through composite video. analog RGB,
digital TTL, etcetera... Even "proprietary / OEM" versions of existing monitors for various brands.

Not to mention ECP. One uses synchronous data transfer, the other
asynchronous and direct memory access (in a good system) in stead
of a polling or interrupt mechanism.

:-)

All of which a $700 standard Atari Falcon does as well. Okay so it costs
843kB /second.
Standard ISA has a 16-bit bus bandwidth with a 8MHz clock frequency -
sometimes higher,
like 10MHz ("enhanced" option in BIOS). 16 bits = 2 x 8 bits = 2 bytes.
8MHz = 8,000,000 / second. 2 bytes x 8,000,000 = 16 megabytes / second (in
theory, right?).
Take some bandwidth off becayse of other devices still connected to the ISA
bus (do not count video card,
since these are nowadays connected to PCI or even AGP) like low-speed serial
ports and
such (if they're not in an IC or PLC on your mainboard already).

Do you still think ISA couldn't cope with 843 x 1024 bytes per second if it
can cope with 16,777,216??
Okay so let's divide it by two to account for any other possible limits in
the system or chipset or
lost traffic along the way - it doesn't matter - try accounting for every
possible flaw.

You're still left with 8Mbytes/sec performance. Even if you say that ISA
causes more CPU overhead,
you're still left with plenty of badnwidth. If you experience any problems,
chances are you'll get more luck
if you look into the combined performance of your SCSI controller and disk.
Right combo?
Don't use IDE for it as this causes again extra overhead on your CPU (which
you can compensate for
using a soundcard with a dedicated memory and/or a dedicated processor to
process the datastream and
also makes your soundcard one hell of a lot more expansive). Phew - am I
glad I use a Falcon...

>SIMM chips were removed because they are useless on a fast machine. They

Won't argue with that, DIMM replaced SIMM not only because of performance,
but moreso to overcome
the problem that Pentium PC's usually require SIMMs in PAIRS. A DIMM already
consists of TWO (DUAL).
Hmm - a collegue also noted that DIMM has a full 32-bits wide bus to the
system, and SIMMs have a 16-bit
(or so) bus.

Keep it up :-)

Forgot something: how about 8-bit Token Ring cards (16Mbit/sec) in PC's? Take a hell of a lot more bandwidth than your 843K. So PCI a necessity for soundcards? Perhaps they make things easier for everyone, but that's about it.

The prime value of a PCI soundcard would be more
sensible autodetection. PCI is quite nice when
compared to ISA 'attempts' at PnP. It also allows
you to not have to strictly partition your slots.

I'd love an all PCI system with as many slots as
my old VL system had.

Why do they need so many pins? SIMMs having 32 bits made sense to be cause you could have power + ground + 32 data + 32 address + 6 control. What do they do with all of the pins?

2782. TAF meeting October 21st - Secrets of LINUX

Newsgroup: comp.sys.atari.advocacy
Date: 1998-10-17 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <36288e2a.0@nemo.idirect.com>
Source record: 4443
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy

Agenda for Toronto Atari Federation meeting, October 21st 1998:

there's a very popular operating system out there - and Atarians
can use it!

On October 21st, TAF will be hosting a night to discuss about
LINUX, the UNIX-like operating system that's been growing very popular
with the PC crowd, and has recently made the news what with Intel
recently investing in a company that distributes it. And remarkably, we
can even install versions of this on TTs, Falcons, Hades, DirecTs, etc.

We will have on hand a speaker from the Canadian LINUX club CLUE
who will discuss with us the history and advantages of using this
pre-emptive multitasking system, the software that's used with it, etc.
And hopefully we'll also have it installed on one of our computers as
well for a hands-on demonstartion, as well as other Atarians who use or
program software for LINUX.

This should be a most interesting night! See you there!

PS - November 18th is the next TAF MonSTEr Flea Market! Circle your
calendars now.....

TORONTO ATARI FEDERATION User Group meetings are held on the Third
Wednesday of the Month in the North York Memorial Community Hall on the
Lower (or Concourse) Level of the North York City Centre Library at 5110
Yonge St. at Parkhome Ave. Parking garage inside the complex. Those
using public transport can take the TTC's Yonge-University-Spadina line
to North York Centre Station. Meetings start 7:30 PM, $2.00 to
non-members. Membership is $35 CDN a year, and includes a subscription
to the club newsletter PHOENIX and full use of the TAF Online BBS. A
membership in TAF IS Atari support!

nope. Very little Atari people have to use DejaNews (and those who
do usually set up NEWsie). Your insistence of using DejaNews despite
your constantly bragging about "superior" Mac Internet clients show
it's YOU who has the IQ problem. No such thing as an Atari Jihad, only in
your feverish paranoid mind....

Why are the TOS cloners not promoting their offerings and getting the word out considering that Jihads claim that its a superior product.

I wonder what claims will be made now to counter OS 8.5 with Sherlock?

I wonder why Apple does not promote their offerings, despite the claim of the
jihad that it is the superior product.

>I wonder what claims will be made now to counter OS 8.5 with Sherlock?

Is Sherlock yet another of those silly codenames Apple use for their "OSes"?
Allegra, Concerto, Gestapo, Panthera, Tomato...
Besides, what does OS 8.5 have to offer? Certainly not PMT, that's for sure.
I've been using it on my father's G3 Powerbook. Not very impressive once you
scratch the pretty surface. I still have to wait for the machine to complete
mundane tasks.

2788. Project X = Project Toilet(?)

Newsgroup: comp.sys.atari.advocacy
Date: 1998-10-22 00:00:00 UTC
From: sinclair2246@my-dejanews.com
Message-ID: <70mgn1$3d$1@nnrp1.dejanews.com>
Source record: 4249
Cross-posted to: comp.sys.atari.advocacy,rec.games.video.atari

Interesting reading in the latest edition(Nov) of Next Generation. There is a interview article with Jim Whimms who helped launched Nintendo to stardom in 1986 and the Sony Playstation in 1995(to bad Atari did not hire him).

Much of the Atari alumni have taken shelter at VM Labs that is developing a new console called Project X. Will Project X suffer the painful death of the Jag? Well, Whimms think so. If this happens what happens to those ex Atari employese again. Working at another company that went down the toilet is not good for the resume.

This is what he has to say about VM Labs:

"project x....then your dreaming. To get into this marketplace, now that Sony is so entrenched, and with Nintendo with $5 billion in cash and no debt...- your looking at tough competition. We've always known that there is only room for one or two systems to succeed because you cannot compete with just 10% or 15% market share - the economic model just doesn't work this way. Ask Sega. All VM Labs has done is buy themselves a two year hall pass(132)."

Looks like those venture capitalists will have a nice tax write off.

Peter S.

I'm a bit surprised about what this guy says about X.

1. X is NOT a videogame-console in that sense.
It is basically a chip providing many "multimedia" operations,
and from these is most important the MPEG2-decoding.
It's not a standalone device, it's a *chip*.

2. The plan seems to be to give X away to the consumer-
electronics industry (licensed). VM Labs will NOT produce
a games machine or anything else themselves.

3. The industry (e.g. Thompson) will produce units that
have X inside (rather than intel inside ;-)). And I guess
that this means DVD-players above all, maybe settop-boxes.

4. X can play games, too. But when Joe Sixpack buys his
DVD-Player, he won't know or care. He will then discover
that he can play games on his DVD-unit and *might* buy some.

5. Make your own guess how many people will have X in their
homes when all VHS-Tapes are replaced by DVD, and how large the
installed basis would be blahblahblah
There is not really much competition with Big N or Sony... It's
also a console, but won't be sold as one.

6. _MY_ guess: X will be successful moneymaking-wise, but will
fail as games-platform. Jeff Minter is cool and everything, but T3K
just isn't enough. * * *

This is what I've heard, corrections and opinions
are always appreciated. Look at Thompsons Website, their
DVD/whoknowswhat - player is called Blackbird (I think).

---> I'd just *love* to play T3K, though ....!

I saw a screenshot of IS3 on a site that also had pics of the gamepad
and set top boxes by Motorola and Toshiba. It even had a list of
companies who have agreed to make games. I don't remember the site but
I think I got to it through a Jaguar site. I think this was the one.

Any possibility that MilanTOS will ever support UDI or
just plain Linux/FreeBSD drivers? That could widen it's
hardware support to beyond what's available for Petey's
pet machine.

...just so long as the Milan people release their source
if they derive from any of ours...

I know a of at least one existing computer company that openly
invested in another sinking company not to long ago..... And a few
game manufactures too....

Does the fact they were once Atari employees, and worked on a failed
project, make them undesireable? I think that would just about elimate
all the politicians in the U.S.

By the way, how many failed projects have you been involved in,
Sinplop? Every erection you've had?

since Milan is also using nAESw/MiNT also, it would not be too
difficult(?) to port
from the 68k port of LiNUX/BSD to MiNT?? and use it under nAES/MiNT??
(rather than Milan TOS, which is 4.5, non? [Aren't they working on
5.0?])

The fact that GEM was coded in fairly portable C
was one aspect I always found endearing about it.
It's a shame the intel version could never take off.

Cross-posted to: comp.sys.sinclair,comp.sys.amstrad,comp.sys.amstrad.8bit,comp.sys.atari.st,comp.sys.cbm,comp.sys.msx,comp.sys.atari.advocacy,comp.sys.amiga.advocacy

I've crossposted this to every newsgroup I could find that covers the major micros of the 80's and early 90's - hopefully this thread won't turn into a "my computer is better than yours" argument...

Anyway, here's what I'm after: what happened to the original artists behind things like magazine covers, game adverts, game box covers, etc? And (and here's what I'm REALLY after) what's happened with the original artwork? I know that Bob Wakelin has sold his work, what about the others?

I'm also after Oli Frey to this end. Can anyone help?

Nick Humphries, nick@the-den.clara.net, at your service

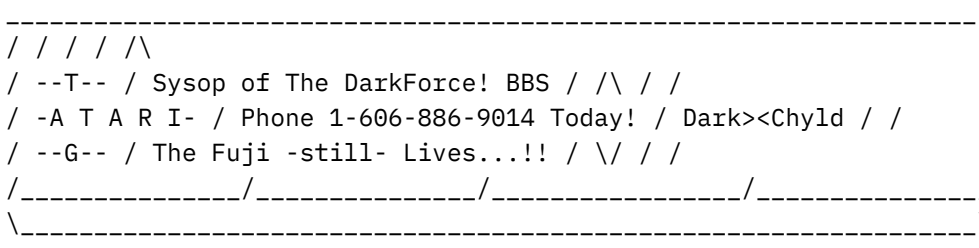
Or if you really want to put him into vapor-lock mode, then we'll tell
him that we are sending him the latest (still unreleased) specs on the
newest "next-generation" Mac computer, only when it gets to him, its on
a floppy disk...(which of cours, the iMac doesn't have)... ;-)

Catch ya later! ;)



2814. TAF MonSTEr Flea Market November 18th

Newsgroup: comp.sys.atari.advocacy
Date: 1998-11-01 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <363c9368.0@nemo.idirect.com>
Source record: 4275
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.atari.8bit,alt.atari

Subj : TAF Flea Market November 18th, 1998.

WEDSNDAY, NOVEMBER 18TH, 1998 is the date for another popular
Toronto Atari Federation FLEA MARKET! The doors open to
the Public at 7:00 PM and runs to 10:30 PM.

Yes, here's your chance to come to a bazaar of Atari-related
software and hardware where you can shop for that peripheral
or application for your ST/TT/Falcon or 8-bit that you've
been looking for. Or, if there's stuff that you have no
use for, get yourself a table and sell! Get rid of your
old stuff or find yourself a treasure!

A Half-Table costs just $5.00, Full-Table just $10.00 each.
A Half-Table is FREE to TAF MEMBERS. (Dealers are expected
to contribute a little more <grin>), with entry to the Flea
Market at $2.00 per family (Free to TAF Members).

The Flea Market itself will run from 7:00-10:30 PM (with
setup commencing after 6:00 PM and teardown at 10:30PM).
This should allow enough time for as many people inside
and outside Toronto to show up.

As usual, piracy cannot and will not be condoned at a TAF Flea
Market - anyone caught selling pirated software or stolen
hardware will be dealt with severely!

Please refer to the bottom of this document regarding getting
in touch with TAF on booking tables or finding the location
of the event - and we'll see you there!

The TORONTO ATARI FEDERATION Flea Market will be held in the
Gold Room of the North York Memorial Community Hall on the
Lower (or Concourse) Level of the North York City Centre
Library Building at 5110 Yonge Street at Parkhome Avenue.
Parking garage inside the complex next to the Novatel Hotel
Those using public transport can take the TTC's line to the
North York City Centre Station and walk through the tunnel
into the concourse, down to the food court, turn left and
find the Memorial Hall.

That's Wednsday, November 18th, 1998, 7:00-10:30 PM for the TAF FLEA
MARKET.

I'm still primed to get debate going here. Whadaya wanna talk about
- possibility of whether something like Sherlock for Apple OS 8.5 could
be cloned for Atari? The good news about how well the Milan has been
received in Europe?

>And no Post Scriptum ;-), I'm not asking YOU.

ah, let TIFKAS (The Idiot Forever Known As Sinclap) in on the party
- everyone knows a clown is funniest when his pratfalls are
unintentional :)

Is it me, or do you get the idea that whenever TIFKAS posts here,
you get the mental image of him parading down main street in broad
daylight with his pants around his ankles? :) Like his recent pathetic
attempt to disrupt the newsgroup with his rantings about Project X and
the former Atarians working on it - guess TIFKAS still hasn't forgiven
Jeff Minter for calling him a w*nker, a tosspot and a t*rd.

SOURCE: The Seattle Times, Washington

DATE: Monday, November 2, 1998

The Seattle Times, Washington via NewsEdge Corporation : WASHINGTON _ When Microsoft's $150 million investment in Apple
Computer was announced with fanfare at a trade show in Boston last y ear, the software companies heralded the deal as a grand
partnership, a win-win for the longtime rivals and a boon for Apple custom ers who counted on using Microsoft software on their Macintosh
computers.

But now, in the government's antitrust lawsuit against Microsoft, Apple is prepared to offer a far more sinister view of the deal.

In written testimony scheduled to be unsealed in U.S. District Court this week or next, sources say an Apple official has charged th at
Microsoft essentially extorted the agreement by holding the struggling company hostage, threatening to withdraw any support for Microsoft
software that runs on Apple _ a potentially lethal blow to Apple's operating system.

Despite objections from key executives, Apple went along, and in return, agreed to give Microsoft's Web browser an edge over competi tor
Netscape by making Microsoft's Internet Explorer the default software on the Mac operating system and agreeing not to promote Ne
tscape's browser. Browsers are used to view content on the World Wide Web.

Those are just the first in a series of new allegations made by Avadis Tevanian, senior vice president of software engineering for A pple,
according to sources close to the case.

Tevanian's testimony reportedly includes charges that Microsoft tried in vain to divide the market for audio-video software with A pple;
sabotaged Apple's audio-video software, QuickTime, so it didn't work well on computers running Microsoft's Internet browser; a nd used
threats and exclusionary tactics to goad Internet-content providers and computer-makers into rejecting QuickTime.

However, when Microsoft cross-examines Tevanian next week, company attorneys will work to portray a different view of the talks wit h
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

Apple. Microsoft says there was no attempt to divide the market _ instead, the companies merely talked about ways to share technol ogy in the burgeoning multimedia-software market.

The top priority of the Apple-Microsoft talks was to settle a patent complaint Apple had lodged with Microsoft, said Microsoft spoke sman Jim Cullinan. In the end, the resolution was a good deal for both _ a fact Microsoft multimedia manager Eric Engstrom plans to emphasize when he takes the stand for the defense.

During the trial this week, government lawyers entered into evidence a scrawled note obtained from Apple Computer. The note, written in 1997 before the deal was signed, confirmed that Microsoft had threatened to stop making the popular Office software for Macintos h computers. If Microsoft did that, Apple's Chief Financial Officer Fred Anderson wrote, ``we were dead'' _ implying that nobody wou ld want to buy the computer if such popular software wouldn't run on it.

Anderson went on to say that Microsoft had offered a ``trading card,'' which was that the Redmond, Wash., giant would continue makin g Office for Macintosh if Apple agreed to feature Microsoft's browser on its computers, dropping Netscape. Apple was essentially ban ned from putting Netscape's browser on the Mac desktop, where it would be more easily accessible, Tevanian reportedly has testified. Apple had been important to Netscape: About one-quarter of the visitors to Netscape's Web site were reportedly Mac users.

The Department of Justice and 20 states say the allegations are at the heart of their landmark antitrust lawsuit against Microsoft . Prosecutors are accusing the company of monopolizing the software market for operating systems and attempting to extend that monop oly to additional areas of software, particularly Internet browsers, in an effort to squelch any attempt to develop a competing oper ating system.

The Microsoft-Apple deal was met with boos and jeers from anti-Microsoft Apple fans attending the MacWorld convention in August 1997 And it was opposed strongly within Apple, Tevanian is said to have testified. Those employees were troubled that the agreement wou ld hurt competition in the browser market and ultimately in the market for operating systems.

But Apple felt it had no choice, Tevanian has told prosecutors.

Withdrawal of support would have had a devastating impact on Macintosh not only because it would hurt sales of the computer, but als o because independent software vendors would question their investment in developing programs for Apple's operating system.

In the market-division attempts, Microsoft allegedly proposed that Apple stop selling software to broadcast video and audio over th e Internet, restricting itself to the smaller market for audio-video editing tools.

Tevanian has told antitrust prosecutors that Microsoft repeatedly attempted to divide the audio-video market between April 1997 and June 1998.

The alleged collusion attempt bears a striking resemblance to allegations by Netscape that Microsoft attempted to divide the browser market.

When Apple rejected the proposal, Microsoft then attempted to use its market power to defeat Apple rather than compete fairly, Tevan ian has told the court. The primary way Microsoft did that was by persuading other computer-industry companies to reject QuickTime.

The first example that Apple cites of dissuading a company from using QuickTime involves Compaq, one of Microsoft's closest partners among computer-makers.

In a pretrial deposition, Apple Worldwide Marketing Vice President Phil Schiller said he was told by Compaq product manager Eric Fed erman that the Texas computer-maker was eager to put QuickTime 3.0 on its Presario computers because it could play digital video dis ks that Microsoft's proprietary multimedia software would not play.

Apple and Compaq officials met at Compaq's Houston offices on March 12. Apple executives demonstrated QuickTime. They said it could be licensed on a royalty basis _ or for free.

Schiller said Compaq engineers at the meeting were excited about the offer, but marketing managers were resistant.

After the meeting, Schiller was approached by Steven Decker, procurement director for Compaq's Presario division. Schiller, in his d eposition, testified that Decker told him: ``You have to understand what's going on here. They're very afraid of doing anything to u pset Microsoft. We are very wary of bundling anything that would upset Microsoft because they touch us in so many places.''

A week after the March meeting, Compaq notified Apple that it would not license QuickTime 3.0.

Heddy Baker, a spokeswoman for Compaq, said she does not know why QuickTime was not included in the Presario. ``Compaq looks at a to n of things before it makes any decision,'' she said.

The second example of pressuring a company to stop using QuickTime involved Avid Technology, a Massachusetts video-editing-software company. Avid was offered a spot on Microsoft's Windows desktop as part of a new sales channel where independent vendors could sell software to Windows users. But the deal was contingent on Avid dropping QuickTime. Avid was eager to promote its Cinema software, wh ich permits personal-computer users to edit home video on their computers.

In January, Avid's Executive Vice President Cliff Jenks told Schiller he was ``under tremendous pressure from Microsoft not to suppo rt QuickTime.'' When Jenks attempted to lobby for a spot on Microsoft's new sales

channel, he reportedly was told by Microsoft, ``Th at's not
good enough. You need to rip QuickTime out of your product if you want to be
in this channel.''

Apple believes this threat led to Avid's decision to join Microsoft as a
partner in Microsoft's new multimedia-editing format that c ompetes
with Apple's QuickTime.

I may not be very good at technical responses, but I think I do a good job of stiring the pot every now and then....

I can understand some view points of current loyal Apple O/S users. Generally they come with a past experience of what computers were suppose to be. It's to bad they became wrapped up in the Microsloth wars of what the O/S will be for the future.

The O/S of the future is here today for a lot of users. MiNT, N_AES as well as MagiC and the clones it operates on is by far the most user friendly and hardware powerful system you can mount on your hard disk. While Win and Mac O/S's provide several more advanced graphical features embeded in the system, the luxury does not come without fault. PC's require massive processing power and capacity just to carry out the simplest of functions, and the Mac O/S still suffers from incompatibilites. You would think that one or the other company could establish standards where hardware and software installation was not a demeaning factor of owing a machine of the future. But low and behold, even megar twelve year old TOS machines share most of the capability of these new machines.

Current and future TOS clones, with the aid of the available bright programmers that currently hold interest in this market will soon step even beyond the current graphical ability of the other two sets. And once again, we will in ten years be saying, jezzz, we have had that for years.

Image that.....

Oh dear. A terrible thing occurred to me. What if MS refuses further developement of it's extraordinary-it's-a-must-to-use Word program on the Atari platform unless we all install Internet Exploder on our machines? Do we have to settle for Papyrus? What a grim future...

Is this really fun to you? I understand why the Atari fanatics do it.. but why do you? Choice of computer is just choice of tool.. what do you care what tool someone else uses?

You only seem to make yourself look silly by posting.. do you have nothing better to do then argue about someone else's choice of computer? Does it somehow make you feel better because you have a 'better' computer? Does it make you feel more valid? More of a man? Is your life so lonely and dark that you need this kind of validation?

I honestly don't understand why you bother.. don't you have something more interesting and productive to do?

Hello,

Note that Mr Paul Finch (Portfolio Club U.K) E-mail address has
changed from pfinch@mettav.demon.co.uk,
To: paulfinch@x-stream.co.uk
The telephone number stays at +44 (0) 181-286-8990 (answermachine)

Please pass this information on to one other person.

Also:

WHAT HAS HAPPENED TO THE TAVERN BBS?

Can anyone help me with the above, which is a London (England, U.K) based BBS.

I was logging onto them approx once a week when suddenly the number just
started to ring and ring but does not log on to the BBS. Yes, all my computer
equipment does work as that is how I got here!

I have even wrote to Mr Paul Baker (the Syops) but no reply!

HELP, does anyone know what has happened to 'The Tavern BBS'?

Paul

We MUST keep the Atari Portfolio Alive!

>Who is Jeff Minter?

probably one of the most legendary games programmers of the last 20
years; you may have heard of him from games like Llamatron 2112 and
Revenge Of The Mutant Camels, as well as light synths like Trip-A-Tron.
I believe he got his start programming games for the Commodore 64, then
moved on to do games for both Amiga and the ST, both commercial and
shareware. (He did one Falcon game, LlamaZap, which is bloody
incredible - you had to steer a spaceship on several levels, one of
which had you fighting a 50-foot LlamaZord - did I mention he has this
thing for putting ungulate animals in his games?).

He also was briefly employed by Atari during the Jaguar's heyday -
he programmed Defender 2000 and Tempest 2000, as well as programming an
incredible light organ program in the Jaguar CD-ROM unit. These days
he's working on Project X with a number of other ex-Atari employees.

Last Easter I downloaded NoSTalgia, an Atari ST emulator for the
Mac, onto my brother's Performa; included with it was a copy of Revenge
Of The Mutant Camels (which is shareware). Although it ran a bit
sluggishly, my brother and niece were taking turns giving it a go, they
were quite entertained by it. Still is very addictive despite its age.

2829. iMac sales slipping.....

Newsgroup: comp.sys.atari.advocacy
Date: 1998-11-06 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <36432208.0@nemo.idirect.com>
Source record: 4290

well, here's some interesting news about how Apple's
"revolutionary" new iMac has REALLY been selling: hot out the gate, but
now rapidly cooling now that the initial rush of fanboys buying this
new Mac has dropped to a trickle - as I predicted. Do note too the
numbers of product shipped vs. actually sold.

Also note: the expert quoted mentions that the iMac is priced too
high and is underfeatured, as well as its relatively smaller software
base.

Of course, TIFKAS (The Idiot Forever Known As Sinclap) will try to
put some sort of positive spin on this by quoting some sort of Steve
Jobs Reality-Distortion Field® -fueled press release (or try to throw some
smokescreen like bragging what a "macho stud" he is, or making fun of
my appearance). Sorry, clown, but the circus just left town.....

Although Apple (NASDAQ:AAPL) shipped 278,000 iMacs during the product's
first six weeks, only about 76,000 of those actually landed in the hands of
customers, according to ZD Market Intelligent analyst Aaron Goldberg.

Sales during September were about half those in August. And they
slipped further in October, said Goldberg, who compiled the data by
interviewing resellers.

ANALYSIS: IMAC MOMENTUM STALLS AFTER FAST START

Some Apple watchers said the numbers aren't surprising, especially
considering the hype that drove true believers to the stores in droves
the day the iMac went on sale. Many retailers sold out.

"The iMac is a product that trades on emotion," Dataquest analyst Scott Miller said. "It's like those people who ran out and bought the first Beetles. At some point you run through those buyers and you have to get that next generation of user."

To reach that generation, Apple has to stress the iMacs value and simplicity, he said.

PRICE TOO HIGH

But Goldberg warns that one of the major barriers to iMac is still its price tag, $1299, in a world where computers are dipping as low as $599. Also, many potential buyers are still wary of the iMac's lack of a floppy drive and the relatively small selection of Mac software.

Message-ID: <3643d2c8.0@nemo.idirect.com>
Source record: 4292
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.atari.8bit,alt.atari

WEDNSDAY, NOVEMBER 18, 1998 is the date for the Toronto
Atari Federation FLEA MARKET! The doors open to the
public at 7:00 PM and will remain open until 10:30 PM.

This is your chance to come to a bazaar of Atari related pre-owned
hardware and software where you may find that peripheral, application or
utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your
XL/XE 8-bit classic computer system.

If you have original software or hardware that you no longer have any
use for, get yourself a half-table and try to sell it! Or find that
treasure that you have always wanted. Great deals should be in
abundance.

Half-Table's will be $5.00 or the Full-Table for $10.00 each.
Half-Table's are FREE to TAF MEMBERS. Admission is $2.00 per non-member
family but if you are selling and have taken a half-table or more,
admission is inc- luded. Admission for TAF members is, of course, Free.

The Flea Market will run from 7:00 PM to 10:30PM, with setup commencing
for sellors after 6:30 PM, and teardown after 10:30 PM. This should
allow enough time for as many people inside and outside Toronto to
attend the event.

As usual, piracy cannot and will not be condoned. You must be selling
original pre-owned software only. If anyone is caught selling pirated
software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Rose Room"
of the North York Memorial Community Hall on the Lower or Concourse
Level of the North York City Centre Library Building at 5110 Yonge
Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5
stoplights North of Hwy 401 running East off of Yonge

allow enough time for as many people inside and outside Toronto to
attend the event.

As usual, piracy cannot and will not be condoned. You must be selling
original pre-owned software only. If anyone is caught selling pirated
software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Rose Room"
of the North York Memorial Community Hall on the Lower or Concourse
Level of the North York City Centre Library Building at 5110 Yonge
Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5
stoplights North of Hwy 401 running East off of Yonge

The Project X posting was a legitimate debate post. I suggest you read the
article...does have valid points.

The iMac has sold very well. There has been lul in computer sales(ie, wintel
also) in traditional slow October. However, sales of all computers have been
steady thus far in November from my visits into Wisconsin this week.

I saw the product shipped vs. actual sold number. That has been debunked.
40,000 units were sold, ie. went to folks homes in Japan alone. The same
number all over Europe as well at least three times the number in North
America according to Apple's public notes. Your full of beans as usual.
Plus Apple's G3 pro line has sharply increased to traditional pro markets
according to published remarks in Computer Reseller Weekly.

Nice try..

> Also note: the expert quoted mentions that the iMac is priced too

Another myth. The average consumer wintel machine is priced around the $1300
machine. Thats were the market is. The $599 PC whatever that is may not fly
in the market once folks know what it includes.

Heck Compaq has Presario PII's 400 still above $2000.

Well guys, you persuaded me. Let me tell you the story of me and my Milan. It all started when the dsp from my Falcon gave up working. I had just planned to invest in a afterburner or ct2 and a graficscard. But I considered upgrading a half working Falcon not really worth the money. Then came the Milan in the picture. And for about the same cash I had to spend on my Falcon. So I decided to buy a Milan. Also because it (hopefully) offers more upgrade options in the future.

So, I odered a Milan the Milan-tower you all know from the pictures. But that was a mistake...Because so many people wanted that case it was sold out, and I had to wait 4 weeks before they got new ones. But finally I got it. (with thanks to my supplier ACN to bring it home to me personally the day the received it at their office)

So what did I get? A basic Milan in a big Milantower, 16Mb ram, more than 1 Gb Harddisk, a CD-rom with Naes and some mostly boring software. A modern high res. ps2 mouse, and a 80286 PC keyboard of the kind that says 'klick' when you push a button. Really anoying is that there is no key for the '\' and that you have to treat it as a atari keyboard (for example [shift] [2] gives " and not @, as the button shows)

The first acquaintance of the Milan wasn't really positive. To name just a few of the problems: At first my Atari ptc1426 VGA monitor didn't want to work with the graficscard and I had to buy a new monitor. Then the supplied CD-rom was not readable in my 2speed cdrom player. The centronics printer port was connected the wrong way round on the motherboard. And the only working communication port was not connected to a outside serial interface.

Starting up the Milan is a real joy: It goes very fast. Screen updates are very fast also. Realtime scrolling without flickering! Compared to my Nemisised Falcon is the disk access and printing also very fast.
Most programs that work on a TT or Falcon also work on the Milan or else it often helps to switch off the caches. Yet it is a pity that programs as Apex Media can't be used.
Mint and Naes are working great now. It took me some time to configure it right, but the system now almost never crashes. Still I hope there will be a MagiC for this system soon.

What I'm really missing are games, like Running. And a standard soundcard. And finally I hope it will be posible to use the fastserial port with the next TOS update, because I'm getting sick with the 19200 Baud I have now.

Ciao,
Karsten

Karsten van Vuuren | tjendol@wxs.nl

a) this is a COMPUTER debate area - not games machines. You of all
people should know the difference.

b) you were elegantly debunked by those who replied to you.

cite please. My source was with Ziff-Davis, a well-known and
balanced publisher of computer facts. Plus there has been no
"debunkings" reported in comp.sys.mac.advocacy (a place where you
almost never post, since you'd be rendered "extra-crispy" in seconds :).
I'm demanding cites from you, owing to your well-documented making up
of facts (like "90% of all TOS applications fall over on the Milan -
got a cite for THAT?).

>Your full of beans as usual.

yep, I like beans - pinto, lentil (President's Choice makes an
excellent lentil soup), red and black kidney (for my homemade chili,
which everyone seems to like), navy (a good vegetarian baked bean,

complete with tomatos, onions, and green pepper makes a great meal for
these chilly fall nights) green, yellow wax. Interested too in
trying out fava beans as well (but will skip the nice Chianti).

Being "full of beans" is better than what we all know what YOU'RE
full of - I prescribe some Ex-lax or Geritol, or bran muffins :)

>Plus Apple's G3 pro line has sharply increased to traditional pro markets
>according to published remarks in Computer Reseller Weekly.

printed cite please.
>
>Nice try..

try "bullseye". Or haven't you noticed the plume of smoke coming
from the area of your keister?

>
>> Also note: the expert quoted mentions that the iMac is priced too
>> high and is underfeatured, as well as its relatively smaller software
>> base.
>
>The small software is a figment of your imagination.

nope. Been over to Computer City Canada on the weekend (yep, AKA
InCompUSA) and noticed that while their Apple department, as well as
the entire store, is now much-improved layout-wise, there was still a
miniscule amount of software for Mac as compared to PC. Same situation
at all the remaining Mac dealers in Toronto (the Elm Street branch just went
under, BTW). The U of T's computer department had an absolute dearth of
Mac titles.

You're the one which suffers from figmentation of the imagination -
like claiming that there are "Atari Jihads" that are "out to get you",
that Atari Internet software is "inadequate" when you've never even
tried them for yourself, that you "successfully refuted my complaint"
against you at CedarNet (I find that hard to believe, as David from
CedarNet CONCEDED that you were abusing your ISP privileges), and
claiming that I am a major nutcase with paranoid tendencies who believes
in X-Files/Oliver Stone-like scenerios (wrong again, weinerhead - my
favorite book right now is CASE CLOSED by Gerald Posner <who has a few
interesting things to say about Oliver Stone and Jim Garrison in their
fevered imaginings of grand conspiracies>, and my third favorite
magazine is SKEPTIC. And I only watch the X-Files because (a it's a
great fictional telling of some urban legends, and b) Gillian Anderson
is a total babe :)

No, I take that back, to have imagination, one has to
show signs of intelligence. :)

>
>> Of course, TIFKAS (The Idiot Forever Known As Sinclap) will try to

>I am a lady's man, what can I say....-)

like all your ramblings, I find that hard to believe. The only
women who could cope with your noxious twerpiness are either
negotiable or inflatable.

What about caliing me TIFKAS. It's
>like calling the Pot -Kettle black..

I call you TIFKAS (The Idiot Forever Known As Sinclap) because

a) you're an idiot (a well-proven fact - in fact, one can prove
oneself of how you always get it wrong by using DejaNews. Or simply by
counting all the spelling mistakes in your posts)

b) you'll always be known as Sinclap, no matter if you try using
your real name to post.

Now is that too hard to comprehend? Que pasa, little man?

Now maybe if I was really nasty, I'd be calling you things like

a) the 'Clap
b) Peter, the Hapless Dog-Faced Boy
c) Pig Vomit (oops, Howard Stern probably has that one copyrighted
:))

be thankful I only refer to you as TIFKAS.

>

2837. iMac faster than 400mHz PC? Think Different....

Newsgroup: comp.sys.atari.advocacy
Date: 1998-11-10 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <364888d5.0@nemo.idirect.com>
Source record: 4298

now that TIFKAS (The Idiot Forever Known As Sinclap) has crawled
out from under his rock, here's another posting from
comp.sys.mac.advocacy for him to chew on.....

From: winguy@my-dejanews.com
Newsgroups: comp.sys.mac.advocacy
Subject: CNN: PentiumII crushes iMac with ease
Date: Tue, 10 Nov 1998 00:56:11 GMT
Organization: Deja News - The Leader in Internet Discussion

Think CNN believes Steve Jobs and his lies about the iMac and the PentiumII?
You guessed it. Think Different.

From http://www.cnn.com/TECH/computing/9811/09/macvp2.idg/

'(IDG) -- Sure, the iMac is a cool-looking computer. And the translucent
aquamarine box is helping Apple regain profitability. But interim CEO Steve
Jobs' boast that the iMac is faster than the quickest Pentium II is pure hype
-- and it falls apart under scrutiny.'

'To see whether Apple would make believers out of us, we pitted the iMac
against two Intel-based PCs: a pricier Pentium II-400 system and a Celeron-
based machine that costs about $300 less than the iMac. The results: In its
base $1299 configuration, the iMac finished last in each of our application
tests. The system was nearly as easy to use as the company claims, but its
poor performance means Apple failed in its core mission.'

'With 32MB of RAM (its standard shipping configuration), the iMac got
clobbered on our Excel and 5MB-image Photoshop tests; in fact, the slower of
our two test PCs, a Packard Bell Multimedia 945 with an Intel Celeron-333
processor, finished ahead of the iMac by 55 percent and 80 percent,
respectively, on these tests. And when we compared the iMac to our high-end
system, a $1799 Micro Express MicroFlex-c400A with a Pentium II-400 CPU, the
contest was, well, no contest. The iMac took more than three times as long to
finish a standard series of Excel operations, even after we doubled its RAM.'

I like the part about the iMac finishing last in every test. But then again,
thats nothing new. We have seen that in just about every other test done.
They also speak about the so called 'ease of use' and the lack of a floppy
drive (cha-chin$), but I'll let you go and read that part for yourself. God,
how many times now have professionals in the industry proved without a doubt
Jobs' lies wrong? Must be at least a dozen. Has any gotten through his
reality distortion field? Doubtful. Maybe if we are lucky Apple will get sued
for false advertising. Ahh well, at least most everyone here after reading so
many articles by the industry professionals knows that the iMac cant even
dust a cheap PC not to mention the fastest pentiumII. Those not still caught

firmly in the RDF, that is.

Regards,

WinGuy

==========
Thursday November 12, 10:15 am Eastern Time

Company Press Release

SOURCE: CompUSA Inc.

CompUSA Reports Record iMac Sales Again;
Weekend iMac Sales Beat Record Set at Product's
Launch

DALLAS, Nov. 12 /PRNewswire/ -- CompUSA Inc. (NYSE: CPU - news), America's Largest Computer Superstore retailer, reported record iMac sales for the second time since the product's retail rollout on August 15. Last weekend's iMacs sales were the largest since the product's initial launch in August, making iMac the best selling personal computer in CompUSA's history.

``We're seeing iMac continue to gain momentum with first-time users and families who want to explore the Internet,'' said Jim Halpin, CompUSA president and chief executive officer. ``Our customers are telling us iMac is stylish, easy to use, and since customers can now get it for $29.99 a month, iMac is a great holiday value.''

``Across the nation, iMac was the number one selling desktop model in PC superstores in August and September with 12.3 percent and 9.8 percent channel sales respectively,'' according to Matt Sargent, industry analyst at ZD Market Intelligence, a leading industry research firm that tracks technology distribution channels.

CompUSA plans to continue attracting new customers to iMac with a variety of promotions and incentives. This past weekend, incentives such as free USB peripherals triggered a significant increase in store traffic and sales. Apple's recently introduced financing program, which enables customers to buy an iMac for just $29.99 per month, was also

cited as a draw by CompUSA customers.

CompUSA Inc. is one of the nation's leading retailers and resellers of personal computers and related products and services. The company currently operates 209 CompUSA Computer Superstores in 78 major metropolitan markets across the United States that serve retail, corporate, government and education customers and include technical service departments and classroom training facilities. CompUSA also offers its own build-to-order personal computer series, the CompUSA PCTM, and operates an Internet web site located at www.compusa.com where customers can obtain information about the company and shop its on-line catalog.

>CC: sinclair2000@earthlink.net
>
>What were you saying about cedarnet?

that you were reprimanded for posting MCIBTYC drivel in comp.sys.atari.st - NOT that you were removed from Cedarnet. (In fact, I requested that Cedarnet NOT remove you but that they deal with you accordingly. The fact that you stopped posting there immediately after the letter was sent proves that something happened - and was NOT in your favour). Looks like your attempt to rewrite history has failed - AGAIN.

hmm, another set of addresses to add to POPwatch's killfile. BTW, you phone there long distance to send the drivel, or are you not in Missouri as you claim?

In either case, you were warned not to send me e-mail. That still stands.

<rest of unverifiable self-serving drivel snipped>

yeah, I was waiting for you to publish that press-release - it fits your modus operandi.

Interestingly, I notice that there were really no hard numbers posted. Also, in mac.advocacy, a number of their denizens are musing on how much the press release sounds like it was written by Apple's ad agency. Could they be going into damage control after the ZDNet article?

Of course, InCompUSA needs all the help they can get - lost around $50 million last quarter, n'est-ce pas?

Plus Best Buy - reports are that the salesmen are treating the iMac with contempt around the US, just like when Apple tried being distributed by BB the last time and crashed and burned. Guys in mac.advocacy are placing bets now that your uberboss and boot-lickee, Steve Jobs, will be pulling the plug on BB by February...

My own research revealed something interesting - if the iMac is indeed being sold as fast as they're being produced, then all the new ones that are in stock should be the new revision "B" models (with the faster graphics card - Jobs blinked!). Howcome, then, that when I went to several Apple dealers, including CPUsed, the College Street Mac store, and Computer City (aka InCompUSA North) all I could find were "A" (or should that be "eh" :)) iMacs - and all the display models were "A" models. Quite a few of these "A" models sitting in boxes. (Mac.advocacy is reporting that some Apple dealers are offering discounts for the original-issue iMacs over rev. B - they still have back stock?)

Oh, and Compucentre - the Canadian distributor you were bragging about? They certainly got to a good start, charging $50 OVER the CDN MSRP for the first two months for something that's already over priced, overhyped, and underpowered- looks like Jobs should've done his homework before signing the papers......

methinks that rather than coming here looking for stray airdales to kick, and finding only hungry Rottweilers, you may want to go into mac-advocacy and start spinning damage control THERE. Of course, the reason you don't hang out there is that you'd be a pile of onion rings in seconds ("curses! broiled again!") :)

here's a cross-post from comp.sys.mac.advocacy (you know, the place
where TIFKAS <The Idiot Forever Known As Sinclap> is too afraid to post
or read) about the recent InCompUSA press release claiming they've set
another record sale for the overpriced, underpowered iMac. Although
short, it certainly sheds some light on what others are thinking......

My go...

Hypothetically speaking... (as neither C= or Atati exist anymore)

Commodore would never allow themselves to be dragged down to the bottom of the barrel where Atari lives.
Commodore where the wine that almost everyone drank and caused huge enjoyment amongst the consumers, where Atari where the skunge at the bottom of the barrel which an unfortunate few found pleasure in.

How about this one...

Atari users later became iMac users. (bottom of barrel theory still applies here)

Or this one...

Jack Tramiel wanted to merge with C= because he realised his own contraption, named the "ST" was technologically challenged compared to Commodore's Amiga.
Nevertheless, armed with only a MIDI port with intention to trade for the Amiga custom chips "Fat Agnus", "Paula", "Gary", and "Denise" he went of to pay a visit to Commodore.

Said Jack,

I have this to trade...

C= said,

What, a DIN connector???

Said Jack,

Yes, but an integral part of my ST.

Said C=,

So what do you want?

Said Jack,

A trade, a merger, my DIN for your Amiga custom chipset, and operating system.

The C= camp...
Bwaahhaaaahhaaaa heeehehehehheee!!!!!!!!

Jack, you remind me of Apple who came for our glorious OS because it has preemptive multithreaded multitasking and theirs doesn't he he he!!!

... 15 years later...

Apple still hasn't got a preemptive multitasking OS...
BWWAAAAHHHHhehehehe!!!

:-)

Regards,

Clockmeister.

Commodore sucked, otherwise they wouldn't have let a machine as far ahead
of its time as the Amiga was, die on the vine... ;(

->Commodore where the wine that almost everyone drank and caused huge
->enjoyment amongst the consumers, where Atari where the skunge at the bottom
->of the barrel which an unfortunate few found pleasure in.

I hated the C-64, but thought the Amiga was okay. Except for its OS, which
was strange in early versions. (I like WB 2.x and up though).

->How about this one...
->
->Atari users later became iMac users. (bottom of barrel theory still applies
->here)

No way, dude... No self-respecting Atarian is gonna ever sink that low.

->Or this one...
->
->Jack Tramiel wanted to merge with C= because he realised his own
->contraption, named the "ST" was technologically challenged compared to
->Commodore's Amiga.

ClockMeister, you and I have been through this debate. Are we gonna
rehash old material again? ;-)

->Nevertheless, armed with only a MIDI port with intention to trade for the
->Amiga custom chips "Fat Agnus", "Paula", "Gary", and "Denise" he went of to
->pay a visit to Commodore.

Hmm...too bad you can't compare the Amiga's custom chips with the Falcon's
custom chips, eh? ;-)

->Jack, you remind me of Apple who came for our glorious OS because it has
->preemptive multithreaded multitasking and theirs doesn't he he he!!!
->
->.... 15 years later...
->
->Apple still hasn't got a preemptive multitasking OS...
->BWWAAAAHHHHhehehehe!!!

We now have multiple pre-emptive multitasking OS's... What irony. ;-)

Hehe I knew it would provoke SOMETHING :-))))

Although we have been through some aspects of your posting, and we mutually disagreed :-)

But think of it. Combine a Falcon, a Jaguar and a high-end Amiga in every conceivable way (well okay, the good things 'bout them, not counting OS because you could merge those or trade eachother's features (or bugs, as Microsoft calls them.. errrrr gotcha! ;-)) and place it in the hands of a capable mass producer and/or marketeer, e.g. Sony (never mind their playstation pretend it doesn't exist and also pretend they're not heading for the computing hardware market next year)

on a rather sadder note, I was at !ndigo books today on my lunch hour and went looking for a particular PC magazine (only for the CD-ROM, which had tons of Christmas clip-art) and noticed that the latest issue of Amiga Magazine - the UK Amiga mag - was also its final issue. Ironically, it was still pretty fat, compared to the slimmed-down state ST FORMAT found itself at with its last issue.

My condolences to the Amiga community. I actually bought an issue about four years ago (again, to get ahold of a clip art/sound file/MOD CD) and though not an Amiga user I read that issue from cover to cover - well written and laid out, and quite frankly I found myself wishing I had some of those programs running on my Falcon :)

What's the general health of the Amiga magazines these days - for instance, is Future planning to cut back its Amiga coverage? And also, like ATARI COMPUTING, are there any home-brew magazines being put together and sold via subscription by Amigans for Amigans?

Again, my condolences.....

2850. TAF Flea Market - Update

Newsgroup: comp.sys.atari.advocacy
Date: 1998-11-14 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <364d1b43.0@nemo.idirect.com>
Source record: 4161
Cross-posted to: comp.sys.atari.st,comp.sys.atari.advocacy,alt.atari,comp.sys.atari.8bit

a little update to the TAF MonSTEr Flea Market on the 18th of this month....

Those on this forum in Canada who have been wondering about Mario Becroft's new PC Mouse Adaptor will have a chance to see this little gizmo in action at the Flea Market, as Ken Macdonald has brought in five of the little beasties which will be demonstrated. Three have already been earmarked as sold, and TAF is currently looking at putting in an order for more.

BTW, I got a chance to play with one of them at our exec meeting Wednsday and was very impressed - especially since it was attached to a Logitech 3-button mouse. The centre button was configured as a double-click, and was very quickly gotten used to. The Logitech is also very ergonomic and fit the contour of my hand real good. One other thing - Mario has designed the adaptor so that it plugs into the mouse port, then the cable runs under the machine so that the plug for the PC mouse can attach behind the computer - great idea!

anyway, details for the Flea Market follows.....

WEDNSDAY, NOVEMBER 18, 1998 is the date for the Toronto Atari Federation FLEA MARKET! The doors open to the public at 7:00 PM and will remain open until 10:30 PM.

This is your chance to come to a bazaar of Atari related pre-owned hardware and software where you may find that peripheral, application or utility for your ST/Mega/TT/Falcon 16/32-bit computer system or your XL/XE 8-bit classic computer system.

If you have original software or hardware that you no longer have any use for, get yourself a half-table and try to sell it! Or find that treasure that you have always wanted. Great deals should be in abundance.

Half-Table's will be $5.00 or the Full-Table for $10.00 each. Half-Table's are FREE to TAF MEMBERS. Admission is $2.00 per non-member family but if you are selling and have taken a half-table or more, admission is inc- luded. Admission for TAF members is, of course, Free.

The Flea Market will run from 7:00 PM to 10:30PM, with setup commencing for sellors after 6:30 PM, and teardown after 10:30 PM. This should allow enough time for as many people inside and outside Toronto to attend the event.

As usual, piracy cannot and will not be condoned. You must be selling original pre-owned software only. If anyone is caught selling pirated software or stolen hardware, they will be dealt with severely!!

The TORONTO ATARI FEDERATION Flea Market will be held in the "Rose Room" of the North York Memorial Community Hall on the Lower or Concourse Level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkhome Ave. Parkhome is 5 stoplights North of Hwy 401 running East off of Yonge

Daniel, was that Amiga Format? I'm amazed if it is. Thought it was still relatively healthy. I know at the Amiga's heyday in the UK, their circ. was something like 150,000!

I have a few Amiga's as well as all my Atari's and I still get an Amiga magazine here in the US-its called "Amazing Computing (Amiga)", and is a nice little publication. There is also a bi-monthly (not color) mag that is put out, but I forget its name (Amiga Informer, I think).

Gateway, after purchasing the Amiga, formed a new Amiga group, and they made some interesting announcements concerning new product developement. If they deliver what they have promised, then it would be well ahead of any hardware/software currently in use. Time will tell, I guess. ;-)

CU Amiga has just gone under (the one I think the original poster may have
been referring to), mainly due to a change of ownership of the publishing
house. Some other magazines were also axed.

And yes, only time will tell...

Agreed. C= did suck big time, there is a fair bit of sarcasm in my post, as
you may have gathered. What C= did (or didn't) to the Amiga is criminal.

22Million C64 sales speak for themselves, and it was a revolutionary home
computer that captured the users imagination. You can't take that away from
the C64.
WB1.2 and 1.3 were pretty poor, much like early GEM/TOS IMO.

Yeah, you're right!. And people wonder why some still use Atari and Amiga
computers... with the Apple and Wintel stale efforts, some of us will stick
to computers that are actually fun to use.

>underpowered and over priced. An 040 in 1998!

hmmm, I notice that missing from your jingoistic MCIBTYC drivel is the
non-overpriced Milan ($899 US, lower with motherboard kit) which
includes standard PCI slots for connecting a variety of standard PCI
boards (like graphics and sound cards). Not to mention standard printer
and serial ports that don't require USB kludges to run standard
hardware like scanners and printers.....

As for the 040 - well combine it with an elegant, tightly coded OS
(unlike the bloated System 8.5) and you'll get a wonderful machine
that'll run rings around an iMac and kick its little plastic butt. TOS
gets right what Apple couldn't the first time. :)

and surprise surprise - the Hades is still alive. Not only that,
but it can run Cubase right out of the box - something the overpriced,
underpowered, underfeatured iMac is yet to do......

try harder weinerhead. If the iMac really is "flying off the
shelves" (which my research has shown to be not the case), then there
would be no need for InCompUSA to bundle iMacs with VCRs, or put
together bogus payment plans (which, after six years, would well put
what you'd paid for your iMac at over $2100 - now THAT is really overpriced).

No I wasn't. all i got was a message indicating a whiner complaint..Nothing
else. I reduced my usage to cedarnet was due to its short commings like not
being able to log in from other points. Cedarnet is a freenet and became
very limiting to my needs. Thats why I mainly use Earthlink now. When I am
in Iowa I usally telnet in to delete junk email.

> hmm, another set of addresses to add to POPwatch's killfile. BTW,

The hard numbers are not released for competitve reasons. All I can say to
comment with out divulging non disclosure data from were I sit is that CompUSA

can make that claim rightfully.

Best Buy has been a mix bag. Some stores have a different tune and are doing well. May take several months for all the stores to fall in line. I am sure Apple is aware of this and is taking appropriate action like hiring Power reps to evangilize and train.
>

May have to do with a couple of factors: a lul in consumer computers of all makes in October and the news or leaking of the iMac B's existant on the internet put a damper on the remaining sales of iMac A's which are dwindling in the channel.

2860. iMac sales strong....Part B

Newsgroup: comp.sys.atari.advocacy

Evolution: Measuring iMac sales a tricky business

By Eric Yang

This is my first column for MacWEEK.com, although some of you might know me from my Macintosh Evolution Web site, where I have been tracking Apple's financial health with a group of Apple investors for the past 12 months. I had intended to write about Apple's corporate structure, but that plan was tossed aside after an inflammatory article on iMac sales, by ZD InfoBead Insider columnist Aaron Goldberg, grabbed headlines last week.

Goldberg wrote: "Our data showed that in the initial two weeks, from August 15th until the end of the month, an average of 20,000 units were shipped per week. However, in September, iMac volumes dropped to just slightly over 9,000 units a week on average for the month. Clearly not good news."

Based on those figures Goldberg speculated that the iMac must be losing its appeal, but his conclusions are flawed. The variation between August and September unit-shipment volume was a reflection of Apple's distribution strategy and has little correlation with the popularity of the iMac.

The InfoBead survey was limited to the U.S. retail channel, or approximately 25 percent of Apple's total market. The survey did not reflect the international market, education channel or corporate sales.

Months before iMacs hit the shelves Apple anticipated there would be heavy demand for the new product. The company was well aware that even if its manufacturing facilities in Sacramento, Calif., and Singapore were running near full capacity it would not be able to deliver sufficient iMacs to support a simultaneous worldwide product launch. To solve this problem it carefully scheduled a series of launch dates spread over several months, giving itself some needed time to catch up with back orders and build sufficient inventory to support the next launch. The list below shows the sequence of iMac launches:

Aug. 15: United States
Aug. 29: Japan
Sept. 5: UK, Ireland, Germany
Sept. 9: Netherlands
Sept. 10: Mexico

Sept. 12: Italy, Sweden
Sept. 15: New Zealand
Sept. 16: France
Sept. 26: Denmark, Finland
Oct. 17: Singapore
Oct. 19: Taiwan, Estonia

During the two weeks after the initial iMac introduction on Aug. 15, almost the entire supply of iMacs from the Sacramento and Singapore facilities were directed to the U.S. market. Beginning with Japan in late August, iMacs produced from the Singapore facility were gradually diverted to other countries.

Since the InfoBead survey covered only the U.S. retail market, one would expect to see a drop in September volume. After all, during August all iMac production was dedicated to the U.S. market to fill back orders; September production was diverted to reach international markets. Goldberg's logic in using the 20,000-units-per-week rate in August as the benchmark to measure future iMac demand just doesn't hold up under scrutiny.

Suppose a trendy restaurant just opened. On its first day of business a small crowd gathers outside, and at 11 a.m. the doors open and people crowd inside. If the number of customers that walked through the door during the first 10 minutes was twice as many as the following 10 minutes, could one conclude that the restaurant isn't as popular as once thought or that the signature dish -- foie gras a l'iMac -- didn't quite live up to expectation? Certainly not.

Apple's quarterly unit shipment prior to the iMac's introduction had been averaging about 650,000 units. That roughly translates to 12,500 units per week for the U.S. retail channel. Keep in mind that the 12,500 includes Apple's entire product line -- everything from G3 desktops to PowerBooks. For Goldberg to expect a single product to sustain a 20,000-per-week volume in the U.S. retail market is absurd.

My current quarterly estimate of total unit shipment is about 960,000 units, with 500,000 of them being iMacs. Analyst Lou Mazzucchelli of Gerald Klauer Mattison & Co. also expects more than 550,000 iMacs to be shipped for the quarter. If Apple meets these numbers I expect the company to report knockout earnings in January. With the strong Christmas buying season still ahead, Apple is definitely on track to deliver those numbers.

Goldberg is known for his cynical views about Apple. While critical thinking is a positive trait for market analysts, skepticism is not.

In early June, Goldberg speculated that Apple may have practiced "channel stuffing" in order to manufacture profits, but the accusation made little sense. The company's increasing gross margin,

decreasing in-house inventory and growing profit all conflicted
with Goldberg's negative portrayal,
and it was later shown to be unfounded.

Companies generally resort to channel stuffing only when they have difficulty meeting earnings estimates. Channel stuffing may boost profit in one quarter, but those who play this trick end up paying the price in subsequent quarters. Apple had already blown away consensus estimate for two consecutive quarters; if they were the result of channel stuffing, it clearly would have been overkill. Apple has since delivered two more profitable quarters, beating consensus estimates by 52 percent in the third quarter and 39 percent in the fourth. In conference calls with analysts, Apple plainly stated that channel inventory remained flat in terms of unit volume and continues to decrease in terms of value.

It just goes to show that no writer or analyst is infallible.

Independent financial analyst Eric Yang can be reached via e-mail at

my weight (which you seem to overstress, since I'm not quite as
overweight as you think I am) does not inhibit any meaningful
relationship I have with women - which, by the way, is not measured by
sexual conquest or bedpost notching. You seem to be the one who has an
inadequacy problem in how you constantly brag about being a "macho
stud" - which is one of the marks of an internet "kook", BTW.

BZZZT! Wrong! As I have stated carefully before, I lodged a
complaint about you posting your MCIBTYC drivel to David at CedarNet,
who wrote back to me kindly and said that after talking it over with
the other people involved with the situation, conceded that YOU WERE IN
VIOLATION OF YOUR USER AGREEMENTS by posting said drivel (David even
said that you were "an obvious Mac Zealot") and that a warning (i.e., a
reprimand) would be sent to you. A day later, your posts stopped in
c.s.a.s but not in .advocacy (where said drivel rightly remains). Even
to this day, you rarely post to c.s.a.s, much like a whipped puppy
remembers what will happen if it soiled the rug again.

Your denials make for very amusing reading. Care to share with us
any more of your fairytales (like "90% of all TOS applications fall
over on the Milan", or "12 thirty-foot piles of Mac Software", or "I am
a realist") ? Another mark of "kookdom", BTW.

yes, you were. As a matter of fact, I even went as far as to say
that any attempts to send me e-mail would be constituted as harassment
and would be directed to the proper authorities. This due to your
well-known flaming e-mail campaigns. Check out Dejanews in the last
year for the original post....

the claim was being made that iMacs were "flying off the shelves",
thereby there should be, by reason, no original "A" iMacs, only rev B
iMacs. Like to see how you try to spin out of that one, whiner boy.

>Nothing to do with me..

everything to do with you. You posted a press release from Apple in
.advocacy gloating about how CompuCentre had been signed as a
distributor and how they would sell tons of iMacs in my backyard -
forgetting, of course, that I could inspect my backyard and notice any
rot. CompuCentre, as I said, couldn't organize a piss-up in a brewery,
let alone sell tons of iMacs. Even now with iMac prices dropping by $50
at some dealers, they're still overcharging on the iMac in their stores.
Time to admit you have egg on your face.....

Sure can't argue with you there. ;-)

->22 Million C64 sales speak for themselves, and it was a revolutionary home
->computer that captured the users imagination. You can't take that away from
->the C64.
->WB1.2 and 1.3 were pretty poor, much like early GEM/TOS IMO.

Nothing wrong with the C-64's sales, but then there is nothing wrong with
Wintel sales either, eh? <smile> It was just a personal choice for me. I
watched a couple of friends demo the C-64 and the 800 and picked the 800.
Might of had something to do with watching that C-64 owner have to type in
"peek and poke" commands just to load up a game... ;)

Note I'm not degrading the C-64, its just the path I chose...

->Yeah, you're right!. And people wonder why some still use Atari and Amiga
->computers... with the Apple and Wintel stale efforts, some of us will stick
->to computers that are actually fun to use.

Exactly. Fun. Quite a novel concept for Windoze (l)users. ;-)

->> Hmm...too bad you can't compare the Amiga's custom chips with the
->Falcon's
->> custom chips, eh? ;-)
->
->He he he... Pity you can't compare Falcon sales to the Amiga's eh? ;-)

Yeah, that is too bad. Just out of simple curiosity, what did the Amiga's
unit sales wind up at. I know thats kind of a hard figure to generate, but
last I heard (in Amiga Format, I think), it was something like 6 million,
although I'd hazard a guess that there are not that many "active" users.
Would you say that is about right? Thanks.

->Some of us have always had them! :-)
->
->Regards,
->
->Clockmeister.

Oh sure, rub it in, why don't ya! <grin> Well, we did have a very limited
form of co-operative multitasking, what with our .ACC's. 1 app and 6 ACC's
running at the same time sure beat PC's of that era... ;-)

Now we've got Geneva, MagiC, and the awesome Mint! (Unix clone) ;-)

Subject: Polls Show: Public Negative On Megalosoft
Date: Sat, 14 Nov 1998 14:58:38 -0500

Some PC Clown named "JS/PL" <wauseon.@stopat.com> wrote:

> Despit what these threads indicate - the real public is behind Microsoft all
> the way

I DARED him to prove his point.

Here is proof that the DOJ investigation has the approval of the VAST
majority of Americans. Bravo America. Boo JS/PL.

---

1) From <http://www.cnnfn.com/digitaljam/9803/03/poll/>

Many don't believe Gates

Majority don't believe Microsoft isn't trying to
monopolize the Internet

March 3, 1998: 7:56 p.m. ET

NEW YORK (CNNfn) - Where do you think Microsoft is going
today?

A solid majority of online surfers told CNNfn Tuesday they
believe Microsoft Corp. Chairman Bill Gates wants to control the
Internet.

According to an unofficial poll conducted Tuesday, more than
59 percent of online respondents said they thought Gates was
trying to monopolize the Internet and almost 56 percent said the
government should do more to investigate the company.
The poll was based on more than 11,000 responses received
over a nine hour period Tuesday.

. . .

---

2) From <http://cgi.pathfinder.com/cgi-bin/time/daily/gdml3/osform/generic>

Poll
Start Date: 10/27/1998

Was Microsoft Set Up?

Microsoft is accusing Netscape of orchestrating a "setup" for a government antitrust suit at the June 21, 1995, meeting between the two companies. Do you agree with Microsoft's contention?

RESULTS as of 11/14/98 with 67,685 votes cast so far:

YES: 2.25%
NO: 97.53% ***
Don't know: 0.21%

---

3) Here are the best results I can find even remotely in Megalsoft's favor:

From <http://cgi.pathfinder.com/cgi-bin/time/daily/gdml3/osform/generic>

[Having barely begun the trial I think this is telling:]

Start Date: 10/21/1998

Divide Microsoft?

Should Microsoft be broken up the way the old AT&T was?

RESULTS as of 11/14/98:

YES: 47.22%
NO: 51.83% ***
Don't Know: 0.94%

Total Votes Cast: 25351

[Personal comment: I find this shockingly enlightened! Bravo America! And we still have 80% of the trial to dig up more Megalsoft dirt!]

---

4) From <http://205.181.113.18/anchordesk/story/story_1978.html>

QuickPoll Question

Independent polls suggest Microsoft's brand image is suffering amid all its legal woes. Company execs maintain their ratings have never been higher. What do you think?

• I think less of Microsoft. It should quit feuding, get back to the business of building software.

• I applaud Microsoft. I admire the fact it is fighting the government, standing for principle.

QuickPoll Results

• I think less of Microsoft. 24066 votes (71%) ***

[Picked up from alt.fan.bill-gates]

[Please do not reply to me directly, I read this group only occasionally]

[Please do not reply to me directly, I read this group only occasionally]

5) From <http://www.network23.com/hub/msfine/>

Just how much does Megalosoft owe the USA for violated a court order to make available the Windows95® operating system software without requiring the installation of Internet Explorer?

The register is still ringing. The count as of mid-day 11/14/98 was:

$338,531,540

Still think the prosecution of Megalosoft is a waste of money kids?

Need I go on?

I don't think so.

:-D

Between 5 - 6 million, at least 5 mil but certainly no more then 6 mil.
The last estimation was that there are probably 1mil active Amiga users
left, most of which use more then one machine, a lot of which also own a PC
as well, some own a Mac (what a step backwards that is) , and quite a few
are game players using unexpanded A500's. Taking a bit of an educated
guess, I would say that about half of the remaining users have at least
WB2.05+ and some sort of enhancement.

From: Werner Domroese / Q5 <q5@spam.not>
Message-ID: <72nh55$2ee@news3.euro.net>
Source record: 4179

Okay, so my original post at least generated _some_ feedback and a little thread, but it was all techie minded.

Whereas this is all O.K., try to step back for a moment and concentrate on marketing chances only. We just put or techie differences aside for now.

Suppose Atari and Commodore did merger and came up with a common platform based on both companies' techs somehow.

What would have happened to:
* the user base
* market penetration
* global sales

Bare my original post ("Atari and Commodore merge!") in mind regarding marketing and Sony.

How would this have affected the computing market today? Would that fictitious company have provided a viable platform to be reckoned with, next to Apple and Wintel? Would there still be solid support and a viable alternative in terms of points of sale and wide public support, not just fans like ourselves?

WHAT WOULD HAVE HAPPENED TO THE MARKET?

Any thoughts on this?

If the ruling body consisted of Atari/Commodore officials (The Tramiels and
hmm-can't remember the Commodore guys) then the result would have been the
same, although I think that their initial success would have been better,
and they might have lasted longer... ;)

The only way history could have been changed was if different people had
been running each company. Although brilliant in some ways, each made more
than their share of business errors/bad judgement calls... ;(

Well, TBH-I'm trying to remember something that happened in, what...1983?
So what you say is probably right. I just know it was incredibly easy to
start games on the 800 and not as easy on the C-64. Oh well, the C-64 did
wind up getting a GUI, right?

->Between 5 - 6 million, at least 5 mil but certainly no more then 6 mil.

Thats about what I heard. Same way with us. Quite a few (esp. those you
see on the 'Net) have upgraded/updated, but there is still this 1 meg/1040
user base tha exists. Wish we could get them motivated into doing more with
their machines. Bet you Amigans have the same problem, eh? ;-)

Yep, I agree fully. Bad management will be bad management, no matter how
big a company may be, and it will cause the downfall of that company.

I suspect the sales of an Atari/C= merger would have been roughly the
combined total sales of both individual companies. ie: the same.

Regards,

Clockmeister.

Yes, it's a always a relief to know how well off we Amigans are in comparison
to Atarists.

> My condolences to the Amiga community. I actually bought an issue
>about four years ago (again, to get ahold of a clip art/sound file/MOD
>CD) and though not an Amiga user I read that issue from cover to cover
>- well written and laid out, and quite frankly I found myself wishing I
>had some of those programs running on my Falcon :)

It's a real pity, since CU was IMHO a better mag than its arch-nemesis.
According to what I have heard, it didn't fare very badly, but experienced a
slope udiring the summer, which scared stock owners, and since EMAP isn't a
computer publisher...

> What's the general health of the Amiga magazines these days - for
>instance, is Future planning to cut back its Amiga coverage? And also,
>like ATARI COMPUTING, are there any home-brew magazines being put

With CU out of the way, I doubt that Amiga Format is in any way endangered.

There are home-brewn mags, such as the new UK Amiga games mag, whose name I
unfortunately can't remember ATM.

>
>Suppose Atari and Commodore did merger and came up with a common platform
>based on both companies' techs somehow.
>
>What would have happened to:
>* the user base
>* market penetration
>* global sales
>

The user base: would have gone nuts at first (Atarians and Commies are notoriously loyal to their machines). If the resulting product would have been nifty and an overall upgrade from the previous machines, then the user base would have adjusted, joined forces, and the resulting base would become 1.5 times larger than it previously was. Not double - these things are too much too hope for. But a time and a half. Anytime a large group has to merge with another large group, you lose (at least) 25% of the two groups together (people who just give up on the whole thing). There are many marketing examples to parralel this one, as well as other real-world examples.

Market penetration: just like the user base. 1.5. Overall, the merger would yield a marginally larger penetration than either company individually, but at a 'loss' - the 'loss' would benefit both companies, but not in a tremendous amount.

Global sales: There would be an initial spike, that would settle into the above mentioned 1.5 increase, which over time would grow larger or become smaller, based on executive decisions. Just like a good stock.

All of this is dependent on proper management, and great amounts of foresight on the part of that management. Which didn't happen.

The funny thing is, that with a proper marketing budget, either company would have surged to the front. They had a good, reliable machine, which was far more affordable than the 'competition'.

>Bare my original post ("Atari and Commodore merge!") in mind regarding
>marketing and Sony.
>

>How would this have affected the computing market today? Would that
>fictitious company have provided a viable platform to be reckoned with,
next
>to Apple and Wintel? Would there still be solid support and a viable
>alternative in terms of points of sale and wide public support, not just
>fans like ourselves?
>

How would this have affected the computing market today?

If done properly, with proper management, either company could have done it alone (without merging), and we would all be using Ataris/Atari-compatibles instead of IBM compatibles.

If Apple would have continued down the same road that they travelled, then they would done the same as they have done. Except the "other computer" would be an Atari/Commodore.

Atari (and Commodore) needed to penetrate the small/medium business market, a market that was drifting away from mega-expensive mainframes and heading towards personal-level computers and office networking. Atari had an "IBM compatible" machine, but it was superior to the other IBM compatibles of the time, and thus, far more expensive. And Atari did not advertise the machine. Expensive, unknown machines simply do not sell. Commodore never produced a machine that could be used for business (that I know of). These were fatal errors.

Yes, it would be a viable platform to be reckoned with, and may have even stunted (or halted) the Microsoft cartel. There would still be solid support (as much as IBM clones). In fact, Atari would still be producing computers. Commodore too.

>WHAT WOULD HAVE HAPPENED TO THE MARKET?
>

We'd all be using a far more diverse group of machines than we are using now.

>Any thoughts on this?

2878. CompUSA doing okay? Think Different

Newsgroup: comp.sys.atari.advocacy
Date: 1998-11-16 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3650ecf1.0@nemo.idirect.com>
Source record: 4189
Cross-posted to: comp.sys.atari.advocacy,comp.sys.mac.advocacy

well, here's what I found on CompUSA's recent report on their recent quarter. Although they did post a small profit, it looks like they're still in big trouble.....

COMPUSA SEES SALES TROUBLES Shares of software and hardware retailer CompUSA traded lower today after the company reported a 65-percent drop in net income for the first quarter, and warned that sales in the next quarter may come under pressure.

The company said it remains cautious for the second quarter of fiscal 1999, and is currently expecting "low-single digit negative" comparable store sales for the second quarter. Comparable store sales were down 1.7 percent in the first quarter. The company said corporate sales softness, as well as lower average selling prices for products, would result in lower sales numbers for the second quarter. CompUSA stock fell more than nine percent after the earnings announcement, but recovered to end down 0.1875 to 14.8750. Shares have traded as high as 38 and as low as 10.56 over the past 52 weeks.

The company said net income for the quarter fell 65 percent, yet it still managed to report results that beat consensus expectations. CompUSA earned $8.1 million, or 9 cents per share, surpassing expectations by 2 cents, according to consensus of analysts polled by First Call. For the year-ago quarter, CompUSA's net income was $23.5 million, or 25 cents per share.

"Although we are disappointed with our overall financial results for the first quarter of fiscal 1999, we are pleased with the improvements we have made since the fourth quarter of fiscal 1998," said CompUSA president and CEO James Halpin.

CompUSA saw net sales for the first quarter of fiscal 1999 increase 17 percent to $1.39 billion from $1.19 billion for the comparable period ended September 27, 1997. CompUSA said its first quarter earnings per share included a loss of 5 cents from the company's acquisition of Computer City. The loss includes costs of closing Computer City's corporate headquarters, and other operating losses from Computer City stores, according to a release.

"Since we announced our acquisition of Computer City, we have worked aggressively to implement our integration strategy," said Halpin. "We are focused on completing the integration and are excited about the opportunities to improve their operating results."

I was formerly a technician at Computer City before CompUSA bought them out (for the sole purpose of closing them down). After the buyout, I found myself working at CompUSA. From the inside out, that store sucks. I can't imagine anyone except a complete moron doing business with them at all, except to buy software. They do have good prices on software. But, don't bother buying hardware.

Your other sentiments are exactly on the mark. They don't pay their salespeople commission, so their salespeople could give a crap about helping you. In general, they are more worried about the cultlike atmosphere in the corporate sales office than they are about their retail front.

The Tramiels acquired a very crippled company. Their retail channel
was blown up before the tramiels got to Atari. What's amazing is that
the Tramiels kept Atari going for another 10 years. Atari's mistake
was to merge with JTS, what a waste of 45 million dollars. Before the
merger, Atari was actually in pretty good shape, and could have become
a very successful clone manufacturer. The profits and revenues from
making clones could have subsidized Atari's R&D. 1995 was a very bad
year for any computer maker who did not use WIN 95. No small company
could have survived a multibillion dollar advertising and promotional
blitz like that. Atari did however have a huge portfolio of patents,
45 mil in cash and only 42 mil in debt. Financially they were in good
shape. Tramiel gambled that Tom Mitchel could turn the company back
into a fortune 500 company. Unfortunately JTS started about 1 1/2
years to late. Commodore on the other hand was a complete mess
financially and could not continue. All debt and no revenues and no
cash will always kill a company.

Have you ever shopped at a Comp USA. They are the worst. The salemen ignore you, no-one knows where anything is, and tech support only knows that you need more ram and a bigger hard drive. The whole concept of 'warehouse" stores is getting a lot of backlash. Prices go up and the help gets worse. to boost profits, they cut payroll which means the store is being staffed by part-timers and high school kids who could give a shit about their job.

Evolution: Measuring iMac sales a tricky business

By Eric Yang

This is my first column for MacWEEK.com, although some of you might know me from my Macintosh Evolution Web site, where I have been tracking Apple's financial health with a group of Apple investors for the past 12 months. I had intended to write about Apple's corporate structure, but that plan was tossed aside after an inflammatory article on iMac sales, by ZD InfoBead Insider columnist Aaron Goldberg, grabbed headlines last week.

Goldberg wrote: "Our data showed that in the initial two weeks, from August 15th until the end of the month, an average of 20,000 units were shipped per week. However, in September, iMac volumes dropped to just slightly over 9,000 units a week on average for the month. Clearly not good news."

Based on those figures Goldberg speculated that the iMac must be losing its appeal, but his conclusions are flawed. The variation between August and September unit-shipment volume was a reflection of Apple's distribution strategy and has little correlation with the popularity of the iMac.

The InfoBead survey was limited to the U.S. retail channel, or approximately 25 percent of Apple's total market. The survey did not reflect the international market, education channel or corporate sales.

Months before iMacs hit the shelves Apple anticipated there would be heavy demand for the new product. The company was well aware that even if its manufacturing facilities in Sacramento, Calif., and Singapore were running near full capacity it would not be able to deliver sufficient iMacs to support a simultaneous worldwide product launch. To solve this problem it carefully scheduled a series of launch dates spread over several months, giving itself some needed time to catch up with back orders and build sufficient inventory to support the next launch. The list below shows the sequence of iMac launches:

Aug. 15: United States
Aug. 29: Japan
Sept. 5: UK, Ireland, Germany
Sept. 9: Netherlands
Sept. 10: Mexico

Sept. 12: Italy, Sweden
Sept. 15: New Zealand
Sept. 16: France
Sept. 26: Denmark, Finland
Oct. 17: Singapore
Oct. 19: Taiwan, Estonia

During the two weeks after the initial iMac introduction on Aug. 15, almost the entire supply of iMacs from the Sacramento and Singapore facilities were directed to the U.S. market. Beginning with Japan in late August, iMacs produced from the Singapore facility were gradually diverted to other countries.

Since the InfoBead survey covered only the U.S. retail market, one would expect to see a drop in September volume. After all, during August all iMac production was dedicated to the U.S. market to fill back orders; September production was diverted to reach international markets. Goldberg's logic in using the 20,000-units-per-week rate in August as the benchmark to measure future iMac demand just doesn't hold up under scrutiny.

Suppose a trendy restaurant just opened. On its first day of business a small crowd gathers outside, and at 11 a.m. the doors open and people crowd inside. If the number of customers that walked through the door during the first 10 minutes was twice as many as the following 10 minutes, could one conclude that the restaurant isn't as popular as once thought or that the signature dish -- foie gras a l'iMac -- didn't quite live up to expectation? Certainly not.

Apple's quarterly unit shipment prior to the iMac's introduction had been averaging about 650,000 units. That roughly translates to 12,500 units per week for the U.S. retail channel. Keep in mind that the 12,500 includes Apple's entire product line -- everything from G3 desktops to PowerBooks. For Goldberg to expect a single product to sustain a 20,000-per-week volume in the U.S. retail market is absurd.

My current quarterly estimate of total unit shipment is about 960,000 units, with 500,000 of them being iMacs. Analyst Lou Mazzucchelli of Gerald Klauer Mattison & Co. also expects more than 550,000 iMacs to be shipped for the quarter. If Apple meets these numbers I expect the company to report knockout earnings in January. With the strong Christmas buying season still ahead, Apple is definitely on track to deliver those numbers.

Goldberg is known for his cynical views about Apple. While critical thinking is a positive trait for market analysts, skepticism is not.

In early June, Goldberg speculated that Apple may have practiced "channel stuffing" in order to manufacture profits, but the accusation made little sense. The company's increasing gross margin,

decreasing in-house inventory and growing profit all conflicted
with Goldberg's negative portrayal,
and it was later shown to be unfounded.

Companies generally resort to channel stuffing only when they have difficulty meeting earnings estimates. Channel stuffing may boost profit in one quarter, but those who play this trick end up paying the price in subsequent quarters. Apple had already blown away consensus estimate for two consecutive quarters; if they were the result of channel stuffing, it clearly would have been overkill. Apple has since delivered two more profitable quarters, beating consensus estimates by 52 percent in the third quarter and 39 percent in the fourth. In conference calls with analysts, Apple plainly stated that channel inventory remained flat in terms of unit volume and continues to decrease in terms of value.

It just goes to show that no writer or analyst is infallible.

There ya go. I mean, just think about it. At one point Atari had a work-
station class machine (The Transputor ATW800) running a version of Unix,
Hellios (sp?), capable of supporting multiple processors (up to 13!),
while Commodore had a very fast A3000 model with a DSP (and much more)
that neither company released. What were they thinking? "oh, can't do
that-these machines are too far ahead of their time!". Duh. The "what-ifs"
could literally drive you crazy thinking about it... ;-)

Anybody else read the Computer Shopper? (I use it to find hardware bargains for my Atari systems!). Anyways, one of my favorite columns is "The Hard Edge". This month, Bill and Alice list the Top Events of the last 20 years.

The Atari 800 made the list... ;-)))))

PS The Macintosh made the list, but it also made the list of the worst 20 events, as well as Steve Jobs returning to Apple...Hehehehehehehehe...!

it's an Atari clone that appeared in Europe a few years ago - based
around a TT architecture, it's available in 040 and 060 Motorola
configurations. Some companies in Europe are selling it configured so
it can run Atari versions of Cubase Audio REALLY fast :) And yes,
despite TIFKAS' overblown claims to the contrary, it's a really nice,
rock-steady, stable computer.

are you, like everyone in comp.sys.mac.advocacy, sick of TIFKAS' jingoistic MCIBTYC rants? Would you like to find out about Mac issues from a clear, rational group of Mac users who aren't afraid to pull punches on what they find about their hardware, their software, their take on where Apple is going?

Well, I found this great site called MacOpinion. And, I am quite impressed - these guys have respect for other platforms and smarts, unlike TIFKAS, who seems to have an agenda all his own against all Atari users, and doing it badly.

Here's an example - an excellent article by a MacOpinion reader on the way the Mac should be promoted to other people. His "don't" examples sound like one particular person we all know......

Oh yes, the address...http://macopinion.com

Think Different - Not Better

October 01 1998
by Rich Locasso
Contributing Reader

As a new Mac owner, about a year now, I have concluded that the most difficult aspect of owning a Mac, by far, hands down, is the constant diet of obsessive, quasi-fanatical, and often irrational and sometimes immature behavior of Mac supporters in favor of their computer and against the PC platform. How any sane and normal Mac owner can keep peace of mind with this constant diet of irrational exuberance year after year escapes me.

The brouhaha over the recent iMac verses PC benchmark test results from PC Magazine is a case in point. The tests clearly showed that in a variety of different real life application programs, the Pentium outperformed the iMac. Simply stated, the testing showed that a 450 MHz Pentium II was a little to a whole lot faster than an iMac, depending on the task.

Judging by the response of many Mac supporters to this article, one would think that the world was ending in seven days! Why it was as if the Gods themselves had conspired with Bill Gates and PC Magazine to make absolutely everything about the article, the test methodology, and the results unfair, invalid and a total affront to all Mac owners. It's an insult, an outrage, and another example of PC lies! One Evangelist subscriber even intoned how "unfair" it was to pit a humble iMac against a Big (and presumably mean) 450MHz Pentium II. Beating up a little iMac like that!

Well, wake up Mac owners. Did you think Steve Jobs had as his objective truth in advertising? Do you think Apple chose the Byte benchmark for Mac/PC

comparison testing because it was a fair and honest index? Have you been lead down the way by the blinders of group think so strong in MacLand that you find it impossible to think and see the impossible?

The results did not surprise me. Indeed, MacAddict Magazine, in the March, 1998, issue, page 54, found similar results. Using a bench mark made up of 17 different functions from Adobe Photoshop, a Mac 7600/120 poked through in 4 minutes, 1 second, a 266MHz G3 in 1 minute 40 seconds, and a 333MHz Pentium II in 1 minute 25 seconds.

As a naive new Mac owner, I posted these results in the Apple Technical Forum and asked if anyone could explain them in light of Apple's assertion that the G3 was up to twice as fast as the Pentium. Well, no one could and people just sort of ignored it. I got the feeling that the MacAddict article was like a dirty little secret that no one wanted to talk about or acknowledge.

So I sent similar inquiries to Evangelist, asking if the Gurus there could account for these results. And not too surprising, the submission was not printed. Nothing ever appears in Evangelist which presents the Mac as inferior to the PC or suggests that the Mac is anything less than superior. No wonder the average Mac user after unending bias of this sort is bewitched, bothered and bewildered.

Advocacy and objectivity are perhaps like oil and water. And this attitude of superiority is found as a subtle and insidious part of most of the Mac web sites. It goes hand in hand with "enthusiasm" - it is a scourge that covers the earth, creeping and seeping over everything like the tomatoes that ate Cleveland. It's as if the implicit credo of the Macintosh supporter is that as much as we try to be humble, we just have to admit, we are superior. It's just the way we are.

Well, I have a very important message for all Mac zealots and advocates regarding your attitude. The message is a sincere one, designed to free you and help you excel. It comes with strong underpinnings from both spiritual practice and the mental health profession. Read it, learn it, believe it.

You Don't Have To Be Better - It's Ok Just To Be Different.

This message serves individuals well as they struggle with personal growth and life's challenges, and often provides the spark for a turn in adjustment in a new and healthier direction. It will do the same for the Mac community.

The basic idea is this: It's okay to like or love something or someone for what they are. They do not have to be better than everyone else in all categories. They do not have to be perfect. The Mac does not have to be wonderful and superior. And it is no reflection on us to love something that is not the best. We love it for what it is, just the way it is, and that is just fine.

When you think this way, you are freed from duress. You find it unimportant if something or someone else can do better or be more effective or be the best. You are content to know yourself and know what you prefer and to make the choice and be comfortable with it. And you can respect and applaud all others for what they are and what unique or different things they may do, things that make them

what they are. You are not threatened by them but rather you can reach out and celebrate them too.

When Mac owners can accept the PC as a marvelous and worthy platform, which it is, and accept their Macs as marvelous and wonderful computers which are simply different, things will be good. We can still work together to make the Mac more productive and to help each other with all the challenges we have. This will never end. But we will waste no more energy on non-productive hate and anger, which is basically what these feelings involve. So much energy currently goes in this direction!

Demonstrating superiority separates, and it dissipates our energy without producing anything of value in return.

I truly believe that if Mac owners forgot about the PC and focused their talents solely on Mac issues, things would be much more pleasant, owners would be happier, and far more progress would be made. And we might find that we would attract more PC users with honey and an honest commitment to help, rather than with what too often appears to them as an elitist and condescending attitude. And we certainly would end the petty and immature banter that currently seasons a lot of Mac dialogue.

So to all Mac owners, may I propose that as Apple continues down a new pathway, that we chose a new pathway as well. Let our new path be this:

THINK DIFFERENT, NOT BETTER.

Accept the above wisdom and be free from the anger that you feel toward all things different from the Mac. No longer be threatened by software, hardware or company presidents outside of the Mac fold. Accept the relief of not having to defend the Mac endlessly, with blind belief in its superiority.

And most importantly, devote your substantial energies and talents toward the wonderful task of continually improving the Mac, working with others who prefer the Mac, and making the Mac do what is important to you in the best way possible.

I sent a letter with the above message to the Evangelist, that bastion of Mac bias and emotionality. That it did not see the light of day was no surprise. Thinking different, not better, is the antithesis of the Evangelist charter. And the Evangelist charter and its implicit clones around the internet is indeed the heart of the problem.

The Mac community needs to gain adulthood. It is time for a change. We all need to begin to lead the way toward a new and far more mature and forward-looking perspective. As a society we have come a long way toward the ethic of equality. We are becoming much more comfortable with diversity and learning how to accept and celebrate the differences between people and cultures. Life becomes much easier as our sense of community becomes larger.

Well, if we can do this with religions, races and cultures, we can do it with computers too. It is time for the Mac community to eliminate this onerous attitude of superiority, bias and prejudice once and for all. Replace it with an

honest respect for other computer and the people who own them, showing grace and class all the way.

That will be a breath of fresh air. It will happen, it is coming. Respect the PC for the wonderful platform that it is, learn from it, grow with it, and yet support and prefer the Mac.

Think Different, Not Better. Relax and enjoy the journey.

funny why they're not discussing this in comp.sys.mac.advocacy -
maybe they don't trust any sort of knee-jerk reactions from MacWeak.
Maybe, after changing your knappies, you could post that over there and
have it properly debunked. But like I said, you have a reputation not
only for getting it wrong, but not double-checking before posting a
press release or article.....

Ducking is the wrong move when you're getting your butt kicked in
cyberspace :)

It's not a lack of revenue that killed Commodore, but the pricks at the top
feeding their fat wallets for all that it was worth.
There was a rumour at the time that another company actually paid the C=
management big dollars to run the company into the ground.
If such a rumour was indeed fact, it wouldn't be too hard to figure out who
that company was...

The Hades is a yesterday decade computer design using a yester decade
processer technology and yester decade Operating system called TOS. You
can't even use DVD, IE and Netscape as browsers. Plus the price is will set
you back to mars

<<snipped a whole lot of tifkas propaganda>>

Regarding the 040....

Give me ONE reason why a 040 is insufficient, especially on an Atari platform, while it can easily do the tasks that PC's need a Pentium for?

Compare:
-funcitonality
-memory requirements
-processor requirements

Ataris don't need a multi-terabyte operating system with gigabyte application software and dito documents. We can do exactly the same with a lot less in the same amount of time.

At least for our platform, there are still good, imaginative, creative programmers. On the Wintel show, there's many a instant-app builder with the likes of Visual Basic and Visual C, using the same huge library of bugs - sorry - features... that M$ brought upon them and taking it for granted, resulting in equally unstable and sluggish performance as M$'s, at least compared to what their app AND the O.S. its running on should be supposed to be capable of, given the relative power of the available hardware. How much is put to good use?

Why do you think that the creators of the old MM100, the PC version of the excellent multimedia app "Scala" on the Amiga, decided to bypass any and all O.S. altogether?

'nuff said :-)

Who is this dude? Who said Mac users could have brains? No I'm only kidding - I have a Mac (please don't beat me...:)) and it's pretty good. Not especially fast, but certainly a more intuitive approach as far as the OS goes. The hardware's put together pretty well, too.

That said, there's nothing quite like having a comparatively simple machine like the ST. A decent ST programmer can know all of the calls in the OS - compare that to more than 8000 (that's eight thousand!!!!!) in the MacOS toolbox.

Computers, as a rule, get slower when they're more complex. Take the PC as an example - MS Word, running under DOS, is far quicker than Word running under Windows (assuming they're run on the same machine of course). The ST (and computer like the Amiga and Acorn Archimedes) are faster 'cos they're leaner - less unnecessary crap to eat away at processing power. If the Mac or the PC had operating systems that were written well (ie more like TOS or Unix) they'd scream along. As it is, my hard disc-equipped 75 MHz Mac 7200 takes LONGER to boot with Mac OS 8.0, with only 10 extensions enabled, than my old floppy drive 4Mb 1040STe (and that's loading SuperBoot, about 6 patches and extensions, around 10 DAs AND a replacement Desktop shell)...

That's another thing - maybe I'm looking in the wrong places, but it seems to me that the simpler systems encourage more experimentation on the part of programmers. I used to look forward to each issue of ST User, to see what new patches and utilities were on the coverdisc. People used to rewrite parts of the OS!!!! These, as ST users will be aware, were usually assembly-language implementations of OS routines such as FPPATCH, which sped up printing by actually getting bytes to the port quicker. Or Chameleon, which allowed the user to dynamically load DAs.

Whew! that's enough from me - enjoy your machines and remember: It's not necessarily the hardware - usually it's the shoddily-written software that;s slowing you down.

In 1992 their slaes were about $80 million USD. If they were only a
software company, they may have been able to survive. But they made
Hardware and $80mil should be their profit , not their sales. Not
that Atari did any better, but Atari was a little more diverse with
their products, ie prtfolio, st series, lynx, jaquar, and as I
recently found out, PC clones.

BTW, have you ever heard of a commodore PC clone called the COLT, they
used to sell these at service merchandise in the US.

Anyway, in 1992, 1993 in order for any alternative computer platform
to compete against the Intel/Microsoft machine that was begginning to
steamroll, they would have needed a lot of money to release a new and
better machine every six months. The release of windows 95 with a
billion dollar ad campaign would have sealed the coffin regardless.

As with all things business, the 16 bit computers took over the 8
bitters and win 95 (32 bit) took over the 16 bitters, I wonder who
will be the leader in a few years when 64 bit platforms are common.

Will it be LINUX?
Will it be TOS?
Will it be AmigaOS?
Will CP/M come back?
or will Windows 2000 rule?

B.P.

The HADES has a 060 option. TOS computers have can easily be
connected to the WEB using STing, CAB, Draconis/Adamas or Wensuite.
These are all currently being sopported. The HADES is taking TOS and
putting it into the configuration that Atari should have in the first
place, a modular design. Have you ever run optimized 68000 code on a
68060 processor.

The HADES may be a bit on the expensive side, but if you got a better
job, than the price should not matter. It's only expensive, because
you can't afford it.

You can also install mint and linux on it.

You can use any standard IDE and SCSI device on it.

As far as DVD, why would you want to watch movies on a computer, tha't
what a TV is for. I'd rather watch a movie on a 40 inch TV than a 17
inch monitor. That is unless you are one of those nerds who like to
look at porno on the computer, in that case, get a life, a job and a
girlfriend

A1000, A500, A600, A1200, A2000,A1500, A2500, A2500UX, A3000, A4000, CD32,
CDTV,
C128, C64, C16, Plus4, the VIC, PET range and all the numerous PC clones
ranging from XT to 486+ compats.

Quite a diverse range really.

> BTW, have you ever heard of a commodore PC clone called the COLT, they
> used to sell these at service merchandise in the US.

Commodore sold PC from the beginning, most of them manufactured by C=.

From the early XT all the way to the last 486's. In fact, Tulip in Europe
own the C= trademark now and are still selling brand new PC's with the same
C= logo on them.

Really?. That would explain why so many people are defecting to Linux and
other OS's I guess. I don't agree with you here... MS won by default, and
that IS the hard reality. Mac OS was and is NEVER going to be a serious
challenger to Wintel dominance, because Apples products are weak.

> As with all things business, the 16 bit computers took over the 8
> bitters and win 95 (32 bit) took over the 16 bitters, I wonder who

Amigas are 32 bit, although the 68000 had a 16bit external bus, it can
still be considered a 32bit processor. Same for the Atari.
Don't forget the many 68020+ full 32 bit machines C= sold as well.
AmigaOS has always been a 32bit OS, and Windows95/98 is a 16bit OS with
some 32 bit support. You do realize that right?.

> Will it be LINUX? Possibly
> Will it be TOS? not likely

fracturing...
>
BeOS Big potential, also heavily influenced by AmigaOS.
QNX The future Amiga OS kernel, and it is fantastic.

Have you tried the QNX demo?.

A Swiss Atari TT clone, based on either a 68040 or a 68060.
In North America, it is sold under the name of "DirecTT".

Those are the silliest arguments I have seen in a long time. Does the
unavailability of a certain web browser make a machine useless? Peter, you
really are a bigger fool than I had thought.

Besides, the OSes of the Hades are more advanced than the MacOS, which still
doesn't multitask. You haven't even run a Hades, Peter, you have no idea what
you are talking about.

And as for the rest of the technology, most of it is based on a fast
architecture and standard PCI components.

And the price is not that bad, I quoted prices earlier this summer which were
acceptable. If those are not to your liking, choose a cheaper platform such as
the Milan.

And you obviously haven't used MacOS. It certainly does multitask,
considering that I'm downloading a file in Netscape, writing this, Claris
Emailer is checking for mail, and if I wanted to I could be copying a
number of files in the Finder, downloading other files in Netscape,
applying Photoshop filters, stuffing and unstuffing files, and just abotu
anything else at the same time. Sure, it's cooperative multitasking, but
it is multitasking, and it works perfectly fine in all but a few rare
instances.

AND why is it so hard for Apple to get pre-emptive multi-tasking? (which is
superior) I mean, the Amiga and Unix have had it since the beginning of
time, and Atari users have multiple pre-emptive multitasking systems. (eg
Mint and MagiC) Doesn't Apple have qualified software engineers? (this is
not a snide remark-I just can't help but wonder!) Or is there some hardware
or software (OS) related reason why it can't be/won't be done on the Mac?

Thanks...

2909. TIFKAS vs. The Hades TOS clone

Newsgroup: comp.sys.atari.advocacy
Date: 1998-11-19 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3654d9a8.0@nemo.idirect.com>
Source record: 4220

Having been told by the woman he was trying to smooth-talk that a
fast Macintosh couldn't compensate for what he lacked,
sinclair2000@earthlink.net (The Idiot Forever Known As Sinclap) wrote:

> >
> >I am in the stores and yes CompUSA can make the claim. The Hades is
> >underpowered and over priced. An 040 in 1998!

>The Hades is a yesterday decade computer design using a yester decade
>processer technology and yester decade Operating system called TOS. You
>can't even use DVD, IE and Netscape as browsers. Plus the price is will set
>you back to mars

hmmm, let's take this apart bit by bit:

"The Hades is a yesterday decade computer design".....

hmm - tower case, 4 PCI slots, 2 ISA slots, 1 VME slot, IDE
interface, SCSI interface, can handle up to 1 gigabyte of RAM, Printer
port, 2 modem ports, lan port, mouse, keyboard and joystick ports.
Sounds pretty 1990s and up-to-date to me.

"using a yester decade processer technology"......

again, TIFKAS gets it wrong. The Hades comes either with a Motorola
68040 or 68060 processor - and both chips were introduced in the mid
1990s (indeed, the LC475 and LC575, and the Quadras, utilizes 68040
processors - by his own yardstick, TIFKAS has said that these fine
computers are junk and not worth your attention). These chips, when
combined with an Atari operating system, go like stink, because they
don't have to deal with the bloated, multi-megabyte operating systems
Apple has foisted upon their users. Speaking of which.....

"and yester decade Operating system called TOS."

BZZZT! WRONG! The TOS found in the Hades is based around a modified
TOS 3, the operating system found in Atari's TT030, a highly-prized
computer for any Atari user (BTW, it came out in 1991, which makes it
part of THIS decade). TIFKAS bases his opinions on his playing with an
original 520ST with TOS 1 a grand total of ONCE ("shades of GEOS if you
ask me", he sniffed). TOS 3 features, among other things, the ability
to have icons on the desktop for launching programs, the ability to
assign icons to particular files and programs, keyboard macros and
shortcuts. (as an aside, the Falcon's TOS - TOS 4 - came out in 1992,
still within this decade).

Want to add a more up-to-date operating system? No problem! There's NaES/MinT, which can add a nice multi-tasking system that can also allow you to utilize a variety of programs ported from UNIX. ASH now makes a version of their popular MagiC operating system that runs on the Hades, and which allows you to congfigure it with a host of powerful features, as well as a group of neat utilities and applications that give you the best of the Windows and Mac enviroments. You can install Linux on this box and make use of the many utilities, applications and drivers this programming community has been cranking out.

By the way, the above alternate operating systems feature true pre-emptive multitasking - an ability that no Macintosh will be able to lay claim to, at least until Mac OSX comes out (and then it'll only work on G3 Macintoshes like the overpriced, underpowered iMac) (of course, Steve Jobs has already insured the need to upgrade your Mac hardware by making sure Mac OS 8.5 will not run on '040-based Macs - kin you say "ORPHAN", boys and girls?).

"You can't even use DVD, IE and Netscape as browsers".

First off, you can't use DVD as a browser on a Mac, either, or on a PC or Amiga! With logic like that, TIFKAS, you'll become a janitor in no time! :)

DVD? Maybe in the near future - when an acceptable cross-platform standard emerges. One thing about Atari users, they get great glee out proving mouth-breathing throwbacks from a primordial swamp like TIFKAS wrong.

Netscape? No problem - just run Linux, compile, serve.

IE4? One big advantage of being an Atari user is being able to sleep at night knowing that none of your money has gone to Billionaire Bill, who has used his wealth and unfair advantage in the market to crush, threaten and bully all who dare to compete against him, including (gasp!) Intel and (GASP!) Apple (speaking of which, wonderful smoke-screen Jobs and Gates gave regarding the $150M "confidence" payment after Gates threatened to crush Apple like a bug by withholding development, eh TIFKAS? Hopefully Jobs cut a deal with the DoJ to go state's evidence against Gates......).

Internet clients? No problem - there's CAB, NEWsie, Light Of Adamas, Draconis, Okami, POPwatch, NEWSwatch, MyMail, aFTP, POPmail, AtarIRC, FracIRC, Wensuite....and the TCP/IP stacks like STiK, STiNG (highly recommended), and PPPConnect. All of which runs happily on a Hades (and many of these run happily on even the lowliest 1-megabyte ST).

"Plus the price is will set you back to mars"

TIFKAS' brain is still on Pluto. While a complete Hades system is still up there, you CAN reduce the price by buying a motherboard from your Hades dealer and then assembling the rest of the components (graphics cards, RAM, drives, etc) to reduce the price. But I think now

with the cheaper '040-based Milan (which has apparently proven to be a big hit in Europe) out there providing healthy competition, we could expect to see some of those prices go down.

BTW, there's an excellent series about the Hades written by Edward S. Baiz, a long-time Atari users from Indiana, that's running in the ST+ fanzine - you can check out this wonderful non-profit Atari resource at http://www.users.zetnet.co.uk/paxton/stp/index.html .

Or even better, why not get it straight from the horse's mouth, and not out of the mouths of whiny little troglodyte disinformationists like TIFKAS?

http://www.ee.ethz.ch/~caschwan/medusa.html

or for the Milan?

http://www.milan-computer.de/html_gb/index2.html

One thing is for certain - with the above screed, TIFKAS has committed another of his classic gaffs, which rates right up there with "Calamus Is Crap, and though I've never used it I've heard enough to comment about it", "90% of all TOS applications fall over on the Milan", "Atari Internet clients are inadequate", "I only state the facts".... Why trust a man who insists on talking to his imaginary friend, "Chunks", constantly tries to rewrite history about his abuse of the Internet against imaginary "Atari Jihads" who are "out to get him and the Mac", and who has proven that George Santayana's noting a fanatic is someone who's redoubled his efforts when he's forgotten what his primary goal was (as in Wile E. Coyote) is quite true? Indeed, who has wasted much of his entire adult life hassling a minority group of a still-popular computer platform who are still happy and productive using a wonderful operating system and applications by telling half-truths and lies about said system ,and heaping abuse upon them when he is corrected by them. What a sad little life you indeed lead, TIFKAS - and I still suggest you see a psychiatrist and sort out your deep-seated anger and face your fears and inadequacies before it's too late.....

Very little, I would think. Atari and Commodore had many strong
points but the message never really got out. Now, if Atari and
Commodore had merged, and then Time-Warner had decided to acquire
them, there may have been a significant difference. Even with all of
the mis-steps that Warner Communications made, they had _enormous_
marketing clout (not to mention the ability to put the Commodore &
Atari machines & logos into their motion pictures). I think if C & A
had merged that the platforms might still be viable, but whatever
their merits, wouldn't have gained a large market share among the
general populous (as opposed to discerning consumers) without the
company being willing to put some money up front first and foremost
for advertising, secondly, and nearly as important, actually producing
enough machines to fulfill the demand (I personally know *many* people
that would have loved to have become part of the ST community, but
couldn't simply because Atari didn't make the machines available in
the US, so they went on to Wintel boxes). I would see a merged Atari

& Commodore against PCs & Macs kind of like RC Cola against Coke &
Pepsi - still hanging in, but very distantly.

Yea right...I imagine all these rabid Jihads call at the same time...Not a chance... Guys and gals we are all busy keeping up with Apple in Comp. If you want to say hi, I will be at Comp next friday - Sun at in Clive, Iowa. But will be at the Bloomington, Roseville, Minnetonka and Woodbury stores earlier in the week.

The truth isn't out there, it's right here! Well spoken, Daniel. Finally an intelligent post as opposed to you-know-who's Apple-ad press releases.

There is one thing that does concern me though. Although things are from the 1990's, the features mentioned for the Hades hardly seem truly 90's development. Perhaps TIFKAS was refering to USB, DVD, Ultra ATA, Fibre Channel and Gigabit ethernet. But then again, the 8-bit Ataris did have - to some extend - their own USB in the early 80's. But then again, give me a reason why an Atari user would NEED USB or Ultra ATA? How many pretty contemptibles are true 90's machines (TIFKAS, may I remind you hat you're 90's Mac will be yester decade technology in less than 2 years... and Oh eh BTW - does your iMac fishtank explode after 2000? our Ataris do not... ;-). How many Macs are? (Really, very smart indeed, no means to get data into the computer but a mouse, a keyboard and the Internet by default. That's a great way to swap and store stuff, especially with system crashes... and with Billy looking over Jobs' shoulder, you should expect a LOT of those)

Man.. even the most hyper-advanced pretty contemptible still has the basic IBM PC architecture and all the fancy hardware stuff you see today (PCI, AGP, EISA, etc, etc.) are desperate attempts to break their boundaries. Don't try to crank up the bus speed of the whole system... well ok, with VLB and PCI it sort of works, but it took a while for it being developed. New tech huh? I believe the C64 had a local bus. Commodore designed their own bus system, and so did Atari, and adapted it to VME, an industrial strength standard for years. Just like 70's technology of Unix-varieties BTW, still and the growing main choice for critical apps (can you say Linux) of professional and power users. As for operatiing systems... we happen to like an operating system that keeps your apps slick and swift. We only need 4MB to do EXACTLY the same that pretty contemptibles or perhaps even Macs can do with 32.... (this figure used to be 16, but with new "enhanced" O.S.'s [or should you say more overhead and built-in browsers...) go figure!). In fact, even the lowliest 512kB machine can still do a lot and has more mem available to apps than most PC's running old MS-DOS versions... speaking of which... there's only ONE 32-bit Windows O.S. and that's NT (you know, the nice try variety). Oh and yes, OS/2, a lot more stable, IMHO. Copland, Win95, Win98, or even Win2000 are all still 16-bit, with the Gates-varieties still with a MS-DOS kernel.

Reminds me of 2-decade ago technology, doesn't it, TIFKAS?

Oh well. We're happy where we are. It seems that you're not. Why bother us then? Buy an Atari and you'll be happy too! :-))

Back In Time, a web site dedicated to all Atari games and computers, has recently expanded, and moved to a new web host at http://www.emuclassics.com/backintime.

The site has information on all Atari game consoles including the 2600, 5200, 7800, Lynx, Jaguar, Pong, etc. Atari computers are covered extensively. Those systems include the 400/800, XL, XE, ST, TT, and Falcon series. Other Atari devices, such as the Hotz Box, are covered. Up to date news on the Atari scene is included. Emulation of these systems on the PC platform, along with arcade emulators, is included. The site also looks at some prototype and vaporware equipment.

The site is full of history and photos. Good Atari web sites are vanishing from the web. It is my intention to make my site a leader in Atari coverage. If you love Atari, you will have to check out Back In Time

Plausible deniability.

Ellison was the one who told the world that Steve Jobs was going to kick out Gil Amelio and take over Apple and put Ellison on the BoD. Jobs denied the claim, of course.

OTOH, Jobs answered a question at the last Apple stockholder's meeting about a $500 MacOS machine by saying "ask me next year."

How do you figure?
The imac is the consumer desktop, the consumer portable is PI, a g3 with a
passive matrix screen, and rumored to be in the $1000 and $1200 range.

2924. new $500 iMac?

while watching the news Sunday night, I saw a report on the Apple iMac - and a rather interesting bit of news that I'm not sure that anybody has commented on yet.

Apparently Larry Ellison was at a computer conference this weekend and made an announcement that sometime in early 1999 a new iMac model will be introduced that will even be more affordable.

Now here's the kicker - Ellison was quoted as saying that this new iMac will retail around a ballpark figure of $500 US.

Now THIS is quite interesting - especially in light of the talk of sub-$600 PCs that are going to be released by Intel vendors.

Now - in order to pare $800 off this new iMac from the current one, what do you think may have to be eliminated? The Ethernet connector? Maybe no monitor (just buy an SVGA, plug it in and go?). I kind of doubt that they'll eliminate one USB connector....

This should prove interesting, especially to those in the Atari community - it may mean that we will have a VERY affordable platform to run MagiCMac on :)

I'm rather surprised, though, that it was Ellison and not Steve Jobs that made the announcement...

'Chunks' will be Popeye in no time...

As iMacs Thrive, Dealers Revive
(11/23/98, 2:08 p.m. ET)
By Todd Wasserman, Computer Retail Week

The success of the iMac that has propelled activity among Apple's smaller specialty retailers is eliciting inquiries from others who want a piece of the company's turnabout.

"We're getting an awful lot of requests, and quite frankly, we're turning down some and putting others on hold," said Jeff Hanson, Apple's senior director of channel sales.

Expanding its channel presence would cap a successful, almost year-long program in which Apple pared several national retailers and three distributors. Last month, the Cupertino, Calif., company added Best Buy as its third national account, joining CompUSA and Micro Center.

Apple's iMac, introduced in August, boosted the company's share of the PC market to 11.7 percent in October, vs. 7.6 percent in October 1997, according to PC Data, in Reston, Va.

Apple is also considering a sub-$1,000 unit, Hanson said. "I think we'd be remiss if we're going to be in the consumer market and not recognize there are certain price points we have to hit," he said.

While demand for the iMac and other products remains strong, Apple has proven to be atypically adept at providing products punctually, retailers said.

"It's been unusually good," said Tony Violanti, vice president of sales for ComputerTown, in Salem, N.H. "It seems like they have their act together."

"Apple has improved dramatically when it comes to forecasting product availability," said Mark Miller, director of

sales, marketing and
communication for MacCenter, in Fort Lauderdale, Fla.

Yet Miller and other Apple dealers said products such as high-end Macs and PowerBooks are still often in short supply.

Hanson said Apple struggled to meet demand on some
products in
mid-September. "We were constrained on some of the
professional-line products and maybe even some of the
PowerBooks,
but in early October, that was resolved," he said.

"One of the biggest steps we took last year was to
consolidate
distribution so we had only two places where I try to
manage inventory
from," he said. Apple chose two distributors, Ingram
Micro and
Pinacor, from a group that also comprised Merisel, Tech
Data, and
Inacom.

In December 1997, Apple moved to a four-week price- protection policy. "In the past, it was pretty open. We'd price- protect [retailers'] on-hand inventory," he said. "The problem is, that allows an awful lot of slop in the way people manage inventory."

Yes, this isn't the first time Larry said Apple was going to do something that later didn't happen. Remember early in the year when he said they were going to make a network computer with a 17" screen for under $1000? Instead it was the iMac (which, while not having a 17" screen or being under $1000, could still be called a network computer :). And remember when he was going to personally buy Apple and put Steve in charge? Well, that one was pretty close... ;)

>OTOH, Jobs answered a question at the last Apple stockholder's meeting

I thought it was sub-$1000 at the time? I didn't think people were even talking about sub-$500 PC's yet...I'm thinking of them meeting that took place sometime before the May iMac announcement, was there a later one?

Actually, I believe that they were asking about a Newton-like system. It
was at the stockholder's meeting last January, as I recall.

No. Apple's next consumer portable (or P1) is slated to start at prices
around $1200 and be much more than a glorified eMate. Ellison would had
to have been talking about a new iMac or successor to the iMac.

well, one thing you could do, Milo, is to vist the Application
Systems Heidelberg site again using Alta Vista's Babelfish function to
translate (I must admit, it works quite well.....).

You can also visit http://bengy.atari.org, or
http://www.telusplanet.net/public/bengy/MINDEX.HTM - this is Bengy
Collins' MagiC Support Page which explains all about the different
versions of MagiC, including MagiCMac (an Atari-compatible operating
system for 68030/040, PowerPC and G3 Macs) and MagiCPC (an Atari
emulator program for Windows '95). Bengy also keeps a demo of MagiCMac
on his pages, so you can try it out and see what you think.

<snip pseudo-proof of why PCs are superior to the Hades, a machine he has never seen or used>

hmmm, where do we begin:

1) posted a private letter from Edward Baiz onto a public forum without his permission - considered poor nettiquette (of course, par for the course for TIFKAS, who thinks USENET is his own public toilet)

2) 300MhZ PCs are still available. But even 400-450mHz PCs are crippled when running buggy operating systems like Windows '9x, whereas the sleek operating systems found on the Hades whizzes right by - including the overpriced, underpowered iMac. Remember too that TIFKAS has proven time and again that he can never be considered an expert on TOS hardware and architecture, to the point that he has to fabricate facts out of smoke and mirrors......(gee, TIFKAS must be running out of arguments when he has to hold up a WINTEL system to try to discredit Hades users - guess he can't use one of his expensive G3 towers to hold it up as a yardstick)

3) Cost factor - well, you can cut the cost factor right down when you buy the motherboard kit from the dealer and add your own parts to PC prices - and it's worth it.. Of course, TIFKAS will whine that it's all "hack n' slash", but then mummy must have told him never to touch a motherboard as there might be icky germs that might get inside him the next time he picks his nose......

4) He picked the wrong guy to try to argue with and smear- as you can see, Edward actually OWNS a Hades, and knows it inside out and what it does. Anyone who tries to wheedle a negative turn out of a GLOWING POSITIVE RESPONSE for his choice of computer must be in dire need of a vacation (or else he hasn't had his two o'clock slapping). I predict

Edward will reply to this, and I shudder to think what will happen to
TIFKAS when he's faced with someone with actual facts instead of Steve
Jobs Reality-Distortion Field - inspired FUD.....

5) TIFKAS loses further points because his choice of "newsreader",
DejaNews, has totally smushed the letter to the point that it's painful
(and pointless) to try and read his fanciful spin on the facts. Surely
one who has bragged loud and long about how Netscape Communicator and
IE4 are "superior Internet Applications" could try to spend a few
minutes to set up their internal USENET capability. Oh, sorry - we're
talking about TIFKAS, the loser troll who can be easily outwitted by a
jar of Vegemite!

BTW, TIFKAS - I notice you still haven't responded to MY rebuttal of
your pathetic attack on the Hades. Chicken? (and BTW, I sent e-mail to
the guy you gave the FUD to with the real facts on the Hades - you're
not going to like what he told me what he thinks of you and you
disinformation campaigns, but then I keep much of my e-mail
correpondance private, and always ask permission.....)

Hmm, I now predict that TIFKAS will post another lame flame to his
imaginary friend "Chunks"......

Yes it was intended quite humorously :-)
As for what 32MB machines can do.... I'd just say this: you can buy a
bog-standard ST for sometimes less than $50 (ok, with 1MB). Try getting a
comparable PC for that. In stead of buying a PC, buy several ST's and
network them :-)) Get a 720k floppy disk with a shareware MIDI-app some DIN
cables and you can do MIDI sequencing (if that's what you want).

Anyway, what you said is all true, but I think you kind of missed the spirit
or intention of the post. :-)

The first Ataris will get problems around 2048 if I'm not mistaken. And the
2000 problem was not with regard to Macs but with regard to many a PC
(pretty contemptible ;-)

This was a general post as a reply to Daniel's and was intended to be taken
with a tiny little bit of humor :)

Sportsfans..

The Hades underperforms todays Pentium at higher cost. From the horses mouth below..

I was told you were cutting down the Hades and saying
things about
subject you did not know anything about. Let me tell
you this, the
Hades 060 is one of the best computers I have ever
used. It is as fast
as a 200-300mhz Pentium and can do most anything. It
can have 1 gig of
memory, takes PCI card as well the older ISA cards. I
can do scanning,
DTP (I use Layout which is also made for the Mac),
get on the NET, get
email and more. As far as it being slow, it is not.
Please, the Mac you
run and sell is a fine piece of work. Stick with it.
Don't cut down
other machines, expecially those that are also a fine
piece of work.
I love my machine and there is nothing you can say to
make me ever
change my mind....

Edward S. Baiz Jr. ebaiz@qtm.net

A comparable PC (from a processor standpoint) would be an 286. A 386 is decisively better than a 68000. I bet that you could get a 386 for around $50. I can't remember what kind of video, sound and memory you'd find in a 386 but, compared to an ST, it would probably be fairly good. Of course, you'd loose the MIDI connectors. I'm actually looking for a 386 class machine to act as a mail and low-volume web server so if someone knows more about pricing, please contact me.

From a processor standpoint yes. But also bare in mind that 386's have poor
busefficiency compared to Intel thingies. I think I said something about
where to
place the 68000, I still think between 286 and 386. But you're right. IBM
PC/AT
was around 1986 I think, just after the first 68000's. And a 68030 machine
is not
that cheap compared to 386, except perhaps some older Macs.
I think the 68020 more likely resembles a 386, and the 68030 between a 386DX
and a 486SX. BTW - A 68000 / 010 could in theory be compared to a 386SX.
The latter you can buy for $50, I agree. But decisively beter heavily
depends on the OS and apps you're using. Sure as application server or file
server under an older O.S.
it's fine. Even current O.S.'s run altough you'll need quite some expensive
30-pin SIMM memory to run them smoothly. :-)

I'm a network administrator so I think I have at least some knowledge in
this area :-)

> including the overpriced, underpowered iMac.

The 060 processors number crunching performance is comparable to that of a Pentium 75 roughly. Ofcourse, with a reasonably efficient operating system (unlike Windows) the computer may feel a great deal faster, certainly more responsive. But when serious number crunching is called for (rendering for example) the processing performance of the 060 doesn't cut it with todays, even yesterdays Pentium chips.

Remember too that TIFKAS
> has proven time and again that he can never be considered an expert on

This is assuming that the fellow has used current Pentiums or G3 Macs before.

A port of Quake should really tell of the relative performance to a PC, MAC or even AmigaQuake 060.

Netscape is quite good really, although IE4 is total monopolistic, disfunctional bloatware.

Roughly...

68000 = 386SX
68010 = 386SX
68020 = 386DX
68030 = 486DX
68040 = 486DX2/4
68060 = P75

From experience, that would seem about right but with the cleaner OS's
(Atari/Amiga) and custom chips the Motorola based systems often perform
much better then this list may suggest.

Most 386's didn't come with a soundcard at all, that was mostly the 486
era.
Video was often VGA 640x480 x 16/256 colours and possibly 800x600x16
colours.

I'm talking most common 386's here, there where exceptions.

A 386DX40's are probably the only usefull 386's I've come across IMO.

Regards,

Clockmeister.

> and a 486SX. BTW - A 68000 / 010 could in theory be compared to a 386SX.

MMU and FPU support was not available in the 68K series until the 68020. A
built-in MMU was added in the 68030. The 80386 processor also has a built-in
MMU. So you cannot compare a 68000/10 to a 80386 unless you aren't going to
use the MMU for anything. Same with the 68020 unless you have an external
MMU.

Actually, I'd run the latest and greatest version of linux. It would run in
4MB and fly with 8MB.

That comparison list is terrible. The 386sx is a much more powerful chip than the 68000/68010/68020. The 386 has a MMU and can support an FPU externally. It also has a 32-bit address bus and internal cache. The 68000/68010 have no cache, no support for an MMU or FPU and 24-bit address busses. The 68020 has no MMU but supports external coprocessors. It also has a 32-bit address bus and internal cache. The 68030 has a MMU but no FPU. The 486DX has both. The 68040MC/EC are rough equivalents to the 486DX2. I have no knowledge of the 68060.

[snipped]

You are mixing processors with systems.

I disagree here. The 486DX has a built-in FPU, the 030 has not.
I'd say 030 sort of equals 486SX in terms of technical specs (not in
performance)
>68040 = 486DX2/4

Depends on which 040. There are 040's with FPU and 040's without FPU, right?
>68060 = P75
What about the EC versions and such??? Any thoughts on this?

>
>From experience, that would seem about right but with the cleaner OS's
>(Atari/Amiga) and custom chips the Motorola based systems often perform
>much better then this list may suggest.

Agreed. I
've seen a 040 system outperform a Pentium II Xeon in DTP apps, hard disk
recording, MIDI sequencing and FMB manipulation. Better system architecture
and cleaner software on a cleaner OS even though its core is 16-bit can do
wonderous things...

Then again, for pure processing power, it's a shame the 060 wasn't developed
any further. Raw processing os probably better on the more recent Intels.
But, as with computers, look at the years those processors were brought to
market and at what price. Then compare to the Intel competition.

Hmmm although Microbilly claims it's impossible I once installed a full

Win95 with all of its applets, drivers, featurews, bugs and everything on a 386SX at 16MHz with 30 megs of HDD space using on the fly, okay, eh I mean "during-coffee-break" data compression on the drive and even had 2 megs left for storage of user data files. But then again, all you had on it was wordpad / write.... *grin*
But hey, it worked...

2951. CPU scales Intel vs. Motorola (was: Re: TIFKAS vs. The Hades TOS clone)

>That comparison list is terrible. The 386sx is a much more powerful chip
than
>the 68000/68010/68020. The 386 has a MMU and can support an FPU externally.

That really depends on how much value or priority you put on the various components of the processor. A Motorola processor is usually known to have a better bus efficiency, which, on low bandwidth systems such as 8MHz ISA, would have benefitted
the system more if there were peripherals that actually used all of the bandwidth of those ISA systems - very few did -> hence other features were more important to cut down cost, but even more on higher bandwidth systems.

Apart from Unix flavors, there were no operating systems for the 386SX that actually made use of the MMU. This is a system problem, not a processor problem.

One more thing about 020 vs. 386SX. The 386SX had a 16-bit external bus and a MMU (it was after all a cut-down 386DX). The 020 a 32-bit external bus and no MMU but support for an external one 68851. They can really not be compared in that manner.

>It also has a 32-bit address bus and internal cache. The 68000/68010 have
no

>cache, no support for an MMU or FPU and 24-bit address busses. The 68020
has

Agreed on that, except for the support. The 68010 supports the 68881 FPU from what I
know, and other _systems_ with 68000's have been known to support an FPU as well (albeit using non-standard methods - but then... the Weitek coprocessors for 386's were non standard as well and required their own address space...)

And don't forget the RapidCad variety of 386's...

>no MMU but supports external coprocessors. It also has a 32-bit address bus
>and internal cache. The 68030 has a MMU but no FPU. The 486DX has both. The

68030 supports 68882, a 486SX is a 486DX without an FPU. 68030 also has an internal cache - yes, it's smaller but it can cope with a smaller cache because of better bus efficiency than the 486.

>68040MC/EC are rough equivalents to the 486DX2. I have no knowledge of the

I agree. There are also 040's that equal a 486DX.

>68060
I'd compare it to a Pentium-class processor, no matter which. Main difference between 060 and Pentium class is bus access I think, not features. I'm not sure, but I think the 060 has a 64-bit bus, but I my confuse it with a Pentium. Anyway, the two had the exact opposite principals of eachother.

Comparison is difficult because of the myriad of different Pentium processors available with different features and bus access systems. There's the P54C (plain Pentium) variety and MMX variety with extra instructions making systems cheaper without the need for dedicated custom chips. Then there was the Pro variety which featured branch prediction and such, mainly used on NT servers and better served true 32-bit operating systems (NOT Win95, 98 or Win32s, but NT and OS/2 or Unix only), then there was the Pentium II, a combo of MMX and Pro with added circuitry, DEC Alpha technology. And a pro version of that, the Xeon, as well as a cut-down version, the Celeron. Ofcourse, there's also AMD's K6 with an additional MMX-like 3D instruction set and greater bus efficiency and it needs less cooling. And Cyrix / IBM's varieties are 'round the corner as well.
>
>[snipped]
<<snipped>>

Okay so here's my comparison table starting at 286 (not below).
It's a BASIC table which does not contain special combinations such as RapidCad, Cyrix 586, Weitek or ITT, or even 020+851 and such. Just BASICS. Yes I know it gets more complicated if you count in other factors and options of those processors. Only attempting to scale things in according to processing principles, the main value being buswidth and address space, then features.

80286 (1986)
68000 (1979)
68010
80386SX (after 386DX)
68020
80386DX (1990), 68030 (1987)
80486SX (after 486DX)
80486DX
P54C (Pentium, 1994)
P55C (Pentium MMX, 1996)
Pentium Pro (1995)

68060 (1995)
Celeron (1997/1998)
Pentium II (1997/1998)
Pentium II Xeon (1997/1998)

Win95. And most people used Microsoft O.S.'s... All this makes the MMU issue
a secondary one, IMHO.

>MMU.
Well, the 386SX had a 16 bit external bus, the 020 a 32-bit one just like
the 386DX. Just because it has no built-in MMU doesn't mean it's not a
32-bit processor. I also believe they had the same address space (32-bit). I
agree on the 68000/010 mostly. I would probably place them somewhere in
between the 286 and the 386SX.

Exactly, YOU would, as would I. But then, I estimate that you are probably a
power user. Most common users are Wintel people. What you say of Linux will
also run fine on 68K, although I agree that for Linux, the MMU definately
becomes an issue, which would make the low-end processor on 68K probably a
030 or in emergencies a 020 with external 851. Although the built-in PMMU of
the 030 is a cut-down version of the 68851 used with the 020.

Didn't OS/2 run on the 386? And didn't Windows 3.1 use the MMU if you had one?
I think it did because there are definately virtual memory settings in Windows
3.1.

> One more thing about 020 vs. 386SX. The 386SX had a 16-bit external bus and

Very true. MMUs are valuable, however, and I think that the 020 losses points
for not having one.

There was no support for F-line instructions until the 020 so you had to hack
in support for external coprocessors. The 386 did provide a standard for
external coprocessors (though I don't remember how).

[snipped]

Your list skips the 68030/68040.

No it doesn't because I wouldn't use a MS OS on a 386 and we are talking
processors and not systems.

The 386 is also a 32-bit processor. The size of the bus does not matter in
deciding the bitness.

Not to get into systems but PCs are definately the place to run linux. PC
versions come first and are usually better tuned than their
68K/MIPs/Alpha/Sparc/ARM counterparts.

Yes, matched as closely as possible (with FPU/486DX, without FPU/486SX).

> >68060 = P75
> What about the EC versions and such??? Any thoughts on this?
>

That is based on current Amiga upgrade boards (actually for the last few
years) and the relative number crunching performance of a 060/50Mhz EC
version (I believe) is that of a P75. Ofcourse, with a clean system
architecture such as the Amiga (and Hades probably) coupled with a lean OS
the "feel" is similar to that of a P200MMX, at least in the Amigas case.
As an example, the 060 commercial release of Quake for the Amiga performs
roughly the same as on a Cyrix P166+ or a Intel Pentium 133. This is a
feature for feature version of Quake, except for the extra options that
were not available on the PC version.

Sure, it works but it's hardly usefull. I installed Win95 on a 386DX40,
with an 80387, 16Mb RAM and 64Kb of external cache and it ran quite well,
considering.
It also ran Quake, very slowly...

Using the upgrade version, the minimum disk space I've ever managed to
consume for Win95 was 50 odd Mb. How you got it on a 30Mb of drive space is
interesting.

Regards,

Clockmeister.

True, but I think Clockmeister more likely referred to the "common" use of
those processors, and thus, systems. But you're right if you limit
everything to processors. I do not dispute that the 386 is a more powerful
processor. I merely stated that the importants of various aspects of a
processor depends on such things as choice of software (e.g. operating
system) and choice of hardware architecture.

>The 386 is also a 32-bit processor. The size of the bus does not matter in
>deciding the bitness.

I know that... But the buswidth does partially affect system performance and
processor AVAILABILITY to software. Indeed, a 4-bit RISC CPU with a 28000
bit bus bandwidth can sometimes be used nicely with a constant data or
instruction stream.

But then the 68000 would also be, at least partially, 32-bit as opposed to
the 286.
Let me ask you a question: Atari claims the Jaguar's main processors to be
64-bit. From your point of view, that would be true. From mine, it would
also be true because I agree with you on the processor standpoint.

But what if you look at it as a system? How would you classify it? Are its
processors put to good use?

After this, try projecting that comparison onto a Wintel or 68K platform. All in all, people use systems not just processors, which means that a comparison might be difficult due to the many factors that are responsible for system performance under certain circumstances and with certain applications. It may well be that a Intel processor is better suited to certain tasks than a Motorola and vice versa, purely because of the type of application and use it makes of the processor. Add to that the way the O.S. handles it and the way it is put in the system architecture, and you might imagine the questionability or validity of black and white statements like A is more powerful than B.

IMHO, it all depends.

>Not to get into systems but PCs are definately the place to run linux. PC
>versions come first and are usually better tuned than their
>68K/MIPs/Alpha/Sparc/ARM counterparts.
Probably, yes. I just said "they run fine", not "better". :-)
On SPARC I'd just use Solaris btw.

But what you provide as argument as to why PC's are the place to run Linux is true for a LOT of software, simply because it's the leading platform in terms of sales and availability. I didn't buy Atari because it was so readily available but because of the sheer pleasure working with its systems provide. :)

<<snip>>
I agree with you on the technical side of things, but I still believe that all is relative to many important factors when processors are put to use.

Yes it did. And so did NT 3.x. But the mainstream of 386's were either
Novell servers (cooperative multitasking) or WinDOS 3.x combinations.

Win 3.x did have virtual memory settings but only global protection and made
little to no use of the MMU's powerful features. That was the main complaint
of many Windows users who got sick of general potrection faults and such.
Win95 offers better protection but the only Win-variety that offers true
seperate memory protection is NT, and partially OS/2.

I missed the 040 yes (had dinner prepared so was in a bit of a hurry...)
The 030 is in ther right next to the 386DX (read my post again :-)
since I believe that is the only real comparison between INtel and
Motorola in terms of technical specs that can be made. The 386DX
didn't have internal cache, did it? How much?

The 040 I would classify along the lines of 486DX varieties, and the 040
without FPU (LC040?) along the lines of the 486SX's.

<<snipped the rest we all know what we're talking about here :-) >>

And the actual performance thing is exactly what I was trying to make clear to others, since there seemed to be some confusing as to what you compared those processors by.

As for Win95 on 30 megs... I used the drivespace compression that comes standard with 95 and did some manual tweaking in msdos.sys (ascii file since Win95) and stuff. I just was in an odd mood and many people mocked me that I had a 386SX lurking around and thought you could only use WIn 3.x on it. So I accepted the challenge to put "their" Win95 on it :-) I even added a speaker.drv from an old 3.1 version to the system and I could play Wave files through the PC speaker.

They didn't believe what they saw, but it can be done with a bit of playing and fiddling around. Most important thing is: you have to outsmart Microsoft who claim a minimum of 50MB and check for that.

You can circumvent disk space check and install Windows on a compressed volume. Just make sure the bootfiles for the system are on the host drive and msdos.sys points to the compressed volume for the rest of Windows. It worked. I must say it is a while ago since I've tried this and since deleted Win95 from that system. I mean - you don't really expect me to run that system that way?

I also have come across an interesting DOS version from Caldera (OpenDOS, former DR-DOS, later renamed back). It's free nowadays and provides limited multitasking. Okay it's not exactly Unix or Amigan or Atarian standards but... it's nice playing around with every now and then. :-)

The 386DX had no internal cache, and only a relatively few 386 motherboards
had external cache. (Any CPU can be cached externally so that's not
important anyway)

<Snip>

Regards,

Clockmeister.

The 68000 is considered a 16-bit implementation of a 32-bit architecture.

> Let me ask you a question: Atari claims the Jaguar's main processors to be

I look at context when thinking about "bitness". In a general purpose
processor, the size of the address registers decide the bitness for me. In a
graphics or bandwith sensitive system (like the Jag), the width of the data
registers or databus decides it for me.

> But what you provide as argument as to why PC's are the place to run Linux

Agreed. But there is a modus in which you can view the "common" or "generic"
type and way a processor is generally / commonly implemented in a system.

For the 68000, this would be in laser printerd, in Palm pilots and "A-team"
(Atari/Amiga/Apple) computers and miscellaneous 16-bit video game systems.

What does this say of its bitness? WHY is it considered a 16-bit
implementation? I'd say a 386SX is considered a 16-bit implementation of the
386/DX as well. Is the 68000 a 24-bit processor? I mean, you seem to not
consider a generic 68000 system necessarily badnwidth-intensive, so by your
standards it would mean that the 16-bit bus is not that important.

Care to enlighten me / us ??

Define "graphics or bandwith" sensitive system? It's not fair to use one
standard for one and another for the other. IMHO, PC's are bandwidth
sensitive systems if they're used for graphics intensive apps such as games
and FMV stuff.

It's good to put everything in a context but you need to provide that
context in your discussions, something that Clockmeister perhaps forgot or
negleckted because he probably thought he was clear enough on that for most
of us.

Some people might even say such a differential comparison may be considered hypocritic, so I'd suggest to be careful and on the safe side, so it's better to provide the context somewhere along a thread that can be referred to, just to make things clear and put everything in perspective. :-)

Yes, agreed. Both processors are 32bit internally, and operate as such and
only have 16bit outside access. Strictly speaking, they are both still
32bit processors, only handicapped by the external bus which limits
throughput, but not functionality of either chip.

Is the 68000 a 24-bit processor? I mean, you seem to not

So by your definition, if a 386DX had a 64bit databus it would be a 64bit
processor. The databus has no influence on the actual processors "bitness".

Not taking any sides in yet another hardware performance debate, but even the most obstanate of debaters on both sides of the issue must admit that for most personal computer users, the real issue is going to be what SOFTWARE is really needed. For most users, the hardware is going to be a secondary issue. Without the necessary SOFTWARE, the most powerful hardware in the world would be totally useless.

The greatest variety of software at this time, unfortunately, is going to be found in the Windoze environment; and that includes in most cases, the necessary software to install many of today's hardware peripherals.

Some examples: If a person's primary need is to be able to play 8-bit games and educational software, an Atari 8-bit system may be the best choice. For MIDI applications, the timing of the Atari 16/32 bit systems can hardly be beat, although most newer software packages are NOT going to be written for those systems any more. For quick and easy Internet access as well as the ability to run most newer software applications, a Windows system will definitely be easier to set up for most people. For the easiest possible setup and ability to run a good variety of contemporary software, an Apple system may be a good choice.

Bottom line, for most people, the BEST system is going to be the one that can run the software the user wants to be able to run. As far as operating systems goes, my personal favorite has always been Atari TOS. It is clean, fast and simple, yet able to do most everything one can possibly want an operating system to do. Unfortunately, the major downside of Atari TOS is that there is going to be very little NEW Software written for that otherwise excellent operating system.

I'm still using, and greatly enjoying, my Atari TT030 system, but also have an IBM 450MHz P-II Win98 system for the ability to run more contemporary software applications that are simply not available for the Atari system.

Best regards to all.

Sheldon

Quit dodging the issue...In all its buggy state, W9? can eventually get the
job done and still run those browser apps that are not available for TOS.

The market does not agree with your iMac pricing criticism.

> 3) Cost factor - well, you can cut the cost factor right down when

> Jobs Reality-Distortion Field - inspired FUD.....

He stated that a Hades is as fast as a 200mz-300mhz Pentium. I believe he was
being genorous here. Also considering 350-450 MHz are common..

> 5) TIFKAS loses further points because his choice of "newsreader",

"The corresponding sucessor of the Motorola 6800 was the 68000 series. Early members of this family, including the 68000 micropressor chip can be regarded as 16-bit implementations of a 32-bit architecture." - Computer Architecture and Organization 2nd Edition

Personally, I would classify the entire 68K series as 32-bit but I'm not John Hayes.

> Define "graphics or bandwith" sensitive system? It's not fair to use one

> and FMV stuff.

I'm thinking about systems like the Jag where the size of the address registers is not relevant. The Jag doesn't need to address more than 4GB or memory so giving it 64-bit address registers is a waste of resources. Giving it 32-bit GPRs and FPRs is definately not a waste of resources. Neither is giving it a 64 or even 128-bit databus.

not necessarily true, see
http://www.clark.net/pub/lawrencc/linux/faq/faq.html
to quote: "The present 2.0 series releases are of "production quality"
and are suitable for general use on the Amiga, Atari and supported
Motorola VME (162, 166 and 167) platforms. The versions of the 2.1
series are generally as stable as their counterparts on Intel platforms
(probably even more stable, as there is more testing between
releases).

It depends entirely on what sort of bloated OS you're running.
For Windows bloatware,or anything else less trim than GEOS, a
386 in no way trumps a 68000.
[deletia]

Also, 'modern' OSes are crippled in anything less than 12M.
While that's nice if you've finally gotten to run Unix. However,
for things as simple as WinDOS or MacOS, that's pisspoor.

The big difference here is that OS/2 and UNIX are good, efficient operating
systems whereas Win95/98 are not.
I think any operating system shouldn't be judged on face value, rather by
the strength of it's core. In that regard OS/2, UNIX, POSIX, QNX, Linux,
AmigaOS, MINIX, and others are sound at core level, which isn't the case
with Windows 95/98 and MacOS IMO.

Feel free to disagree here.

Regards,

Clockmeister.

And its Christmas...the biggest selling season of the year. And since the
esteemed writer has shown they have never heard of a "loss leader" in
retailing. this tactic will result in some extra sales. But it will also
bring in folks who end up buying a PC or some other electronic gear or
appliance once they are in the store. If they sell something at a loss,
that cost could be written of in terms of Advertising expenses, so its not
like they really lose any money. What they gain is customers.

Too bad sinclair doesn't understand retailing..

How does he classify the 386SX? By what standards? If he does not classify it the same as the early 68K series, he is at least in part, pretty hypocritic in his statement. By the same comparison standards, the 386SX is a "16-bit implementation" of the 386. Define implementation.

I said that Intel versions come out first and have better performance. This doesn't contradict my statement. Last time I checked, the 68K version of Linux was 0.0.2 behind the Intel version. I am alse keeping current on the GnuStep project and Intel support is definately the best. As for stability, you should avoid tracking the latest releases if you need very high stability for your purpose (though I track the latest releases and Linux hasn't crashed for 3 months).

Yah. It seems no different than the catalogs dealers who are offering
additional RAM on top of Apple's deal, or RAM + Software, or RAM + a USB
scanner. A cheap VCR is in the same price range of that equipment ($80 -
$120).

Irrelevant. It was a private letter, you should of at least asked
permission to post. Of course, being the boor you are, you decided that
this was a personal attack and decided to "punish" him for daring to
contradict you. Unfortunately, your plan backfired, and your reputation
went even lower in many people's eyes. Quit dodging the issue.

>Quit dodging the issue...In all its buggy state, W9? can eventually get the
>job done and still run those browser apps that are not available for TOS.

I'm not dodging the issue - seems you are. Why should I want to run
a dog operating system like Windows '9x (which you admit is buggy and
bloated) and run IE4, which has shown to have many security leaks over
the last year or so, and doesn't even properly support HTML guidelines
as set by the standards comittee? When I can run something like CAB on
a Hades (which I HAVE done, unlike yourself, who can only pretend to
guess) and get on the Internet easily and quickly without massive
system overhead and requirements. Plus I have other web browsers (Light
Of Adamas, Wensuite) at my disposal should I have my choice...

And if I want Netscape, I can easily run and load Linux, compile,
serve. End of story.

You still haven't explained why you hold up a WINTEL system against
the Hades instead of a Mac - perhaps because you'll be shown up for an
ignorant fool again?

>The market does not agree with your iMac pricing criticism.

hmmm - well, in Canada an iMac costs $1,899 CDN - one can easily
find PCs that will do the same job (and have standard ports for things
like printers, scanners, backup drives, and have standard floppy drives)
for HALF that (many also include a monitor) .

And like I said, I've noticed from my own observations in Mac
stores that the iMac is NOT "flying off the shelves", but still sitting
in boxes in their original release form. One company has only now begun
advertising they have rev B's in stock.

And I don't give a rat's hiney for the market, TIFKAS - in fact, I
hold the opinion that 10,000,000 Elvis fans CAN be wrong. Besides, with
no hard numbers (which you and InCompUSA refuse to divulge - imagine
what Saddam Hussein could do with such info!), we don't know how many
iMacs there are really out there. Reports are also coming in that Best
Buy is also up to their old tricks (check out Dejanews for the thread
"Best Buy Sucks At Selling iMacs" in comp.sys.mac.advocacy for an
incredible first-person account of BB salespeople cluelessness).

I notice that you're also dodging "underpowered". Guess that now
that the evidence is out how Apple rigged the G3 tests, and that real

benchmarks are out that shows that a 300mHz Celeron toasts an iMac, and
a 400mHZ Pentium II can finish the job, that you're suddenly realizing
that the Steve Jobs Reality-Distortion Field® is of no use in
comp.sys.atari.advocacy.....

> next time he picks his nose......

Avoiding the issue..

how am I avoiding the issue when I stated quite clearly that one
could reduce the cost by buying the motherboard from the dealer,
assembling your own parts from PC dealers at the best price and then
doing it yourself? Since Atarians are hobbiests and have done many types
of modifications to their computers (which you have constantly derided
as "hack n' slash", which is well-known with anyone you went up to and
lost against), this should be a natural for them (and easier, too, as it
will just involve plugging things in). Can you build your own G3 Mac in
the same way for less cost? Nope, I didn't think so. It's you who's
dodging the issue by totally ignoring a clear statement on my part...

BTW, I think mummy also told you that keeping your head "up there"
was a no-no, as the lack of oxygen could lead to brain dama...ooops,
too late :)

> 4) He picked the wrong guy to try to argue with and smear- as you

>He stated that a Hades is as fast as a 200mz-300mhz Pentium. I believe he was
>being genorous here. Also considering 350-450 MHz are common..

unlike you, TIFKAS, Edward knows what he speaks of (your knowledge
of PCs is just as abysmal as your knowledge of Ataris and TOS). And I
don't see anyone leaping to your defense here - in fact, in all the
years I've been bashing heads with you, I don't remember one person
piping up to defend you, but a lot of people coming on and refuting
every piece of drivel you've posted.

Funny thing, TIFKAS, is that the recent postings are having the
OPPOSITE effect you were hoping your FUD would accomplish - I've had at
least three or four requests for info on where to get the Hades,
getting parts, what software works, etc. And I've gladly given it to

them, or pointed them in the right direction. Guess now that there will be more Atarians out there, you'll be redoubling the FUD - which of course means another refutation and absolute humiliation on your part, and more people clamouring for info from me, which means....is it really worth it to you?

> 5) TIFKAS loses further points because his choice of "newsreader", > DejaNews, has totally smushed the letter to the point that it's painful > (and pointless) to try and read his fanciful spin on the facts. Oh, sorry - we're > talking about TIFKAS, the loser troll who can be easily outwitted by a > jar of Vegemite!

>Dodging the issue here. Newsreaders will be obsolete soon as portals >espicially personal web pages with usenet feeds take over...

Not dodging the issue. Your trotting out vapourware and vapour situations is dodging the issues on your part in response to a legitimate criticism of your posting style in the HERE and NOW.

Vegemite - 2,056, TIFKAS - ZERO .

> Quit crying over spilled milk...Will not get you anywere..

we all know whose maturity level stopped at age three here, TIFKAS - and we all know who's been having the hissy fits when they've been soundly refuted. And they haven't gotten you anywhere - in fact, they've cemented your reputation as a little loser troll with no life.

> BTW, TIFKAS - I notice you still haven't responded to MY rebuttal of > your pathetic attack on the Hades. Chicken? (and BTW, I sent e-mail to > the guy you gave the FUD to with the real facts on the Hades - you're > not going to like what he told me what he thinks of you and you > disinformation campaigns, but then I keep much of my e-mail > correpondance private, and always ask permission.....)

>Oh must of not seen yet...Been busy earning a living and enjoying a life you >sorely must lack.

or more likely, you're afraid that by answering the original missive you'll show yourself to be an even bigger idiot.

Since you refuse to show any proof that you really are an Apple Power Rep, your overblown claims of money, cars, women are suspect - or that you even have a life. I at least when I'm on the USENET involve myself in other forums than the computer ones. I'm learning Johnny Cash songs. I'm steeling myself up to start recording my own songs after Christmas. Getting Christmas shopping done. May even get out the bike and ride (it's been nice warm weather in Toronto lately). Might even check out a movie at the new 9-theatre mega-complex that's opened up in the mall where I work.

BTW, folks, if TIFKAS responds to this by stating where he'll be next at an InCompUSA and he's in your area, e-mail me - I Have A Cunning Plan that will be non-violent but will properly humiliate the little schmo..... :)

>Seriously 'Chunks', invite your sweet heart home and prepare Campbell's
>'Chunky' soup for her and she will kiss you... Works everytime...

still talking to your imaginary friend, TIFKAS? Don't worry, it'll all be better when mummy gets home and feeds you a big tray of Cheezy Poofs....

(picture TIFKAS as a 400 lb blob speaking at a rally - "Follow your dreams! You can achieve your goals! I am living proof! Beefcake! BEEEEEFFFFFFCCCCAAAAAAAAAAAAAAAKKKKEEEEEE!")

> Hmm, I now predict that TIFKAS will post another lame flame to his
> imaginary friend "Chunks"......

> And you will reply//

well, I am my brother's keeper - and someone has to steer your delusional butt over to the funny farm when you keep insisting on posting to people that aren't there....

(picture TIFKAS sitting at his computer and getting angrier and angrier - "can't....kick...ass.....can't....kick....ass......)

Not only that - in recent days 'Futile Shop' has reopened its shelves
to Apple product which indicates something about market 'acceptence'

Now, if I could only buy a full G3 at an HP or Compaq price (including
some software which Apple sells as an add-on.

I'd still like to even see a Hades in Western Canada !!

The Canadian Curmudgeon (wondering when the Hades is going to show)

So is the iMac. Like we care? What new
has new tech got to offer US?

What new apps can we run that we couldn't run before?
Do we want those apps?

Old tech or not, the Hades has some nice OS's to guide it
as opposed to the "leading" platforms' bloatware attempts
at OS's. Now, even the "second choice" leading platform
that YOU are so fond of... is funded by M.

All you can cry out is browser browser browser. I HAVE to use W9? and WinNT
and all sorts of other DOS and Win varieties as a network administrator and
I am pleased about their flexibility in connectivity. However, I would NEVER
turn in my Atari for any of them, because of
1) their stability problems (yes that includes NT, ESPECIALLY as file
servers, IMHO you'd better use them as application servers -> what they're
good at -> and use Novell Netware as a file server) crash crash crash...
perhaps you should visit alt.microsoft.crash.crash.crash or somethin'
2) their memory-hungriness
3) their hardware resources problems.... sooner or later, address space and
interrupts become an issue...

We DO NOT want THOSE browsers. We have our own, and they're fine. You wanna
know what browser REALLY cuts it on those Wintels? Opera (not more than
about 1.4MB as opposed to IE4 and NS). It supports many different platforms
as well. :-)

And Atarians have CAB, and a number of others which all work just fine for
our needs, and most of all... FAST compared to the Wintel monstrocities.

> external bus that was 16 bit.

Which was exactly my point. So who's mistaken here? As for 16-bit and
8-bit... we could also crop up the 8086 (fully 16 bit, but limited to 1 meg
of memory), 8088 (8-bit databus, otherwise like 8086), the 80186, 80188 (yes
they exist), the 80286 - the first of the Intels to offer 24-bit memory
addressing (16 megs), etc.

In retrospect, I would technically place a 68030 just above a 386 (later
renamed 386DX) because of the latter's lack of internal cache. They are
furthermore both 32-bit in all conceivable ways and both support an external
floating point unit and have built-in PMMU's.

This slightly alters my version of the scales (read thread).

chip.

The width of the databus does not define bitness of the CPU itself for me, but it does say something about system performance at "system" bitness, although only the system's main bus is the issue then, which for a great deal decides system performance, but not exclusively and can be leveled or compromised by other factors e.g. custom chips with dedicated memory and ports, in the system.

BTW - Be careful not to confuse external buswidth with internal buswidth or registers :-)

That is also why SCSI is usually a more intelligent but also more expensive choice as opposed to IDE, which requires support from the main system's CPU and mainboard e.g. system's bus. A 486 with SCSI hard drive can run significantly better with Linux or WinNT than a Pentium with IDE. It depends on what's measured as SCSI devices only need some instructions and then go fiddling on their own. (The SCSI vs. IDE issue is only provided as an example, I don't want to start yet another thread on it).

a similar thought - wouldn't it be great if ASH went and programmed
a version of MagiCPC that would bypass Windows 9x and install itself as
the only operating system?

I know the problem would be adapting the code that works so well
with Motorola processors to the Intel architecture, but boy, by
bypassing Windows I bet you'd have a TOS architecture that would really
scream :)

I know Dan Wilga from Gribnif has for years been innundated with
requests to port Neodesk over to PC to replace Windows' desktop with
something way more intuitive.

One thing for certain - whichever way it's done, it should be done
with the same ability to bring the operating system down to a nice
tight size. PC users would not only find a faster computer, they'd also
find more room on their hard drive - and the ability to put lots of
similarly tightly-coded programs on their hard drive :)

Right, I think ""enjoying" is the keyword here. I too have a PII 450 with Win 98 installed. I had to convince my boss that I really needed all that horse power. Much to my suprise, once out of the box, I find that Win 98 has a real doggy feel even on that machine. My 040/NOVA Falcon with MiNT and NAES is really much more usable in terms of a GUI, IMHO. But egadd, when I went to unzip a 10 megabyte file, it was over before I could blink. The Falcon would have had to work on that a while:). I know there are alternative O/S's for the PC, but I am not into command line stuff, and like the point an click feel of icons.

The processing power is nice on the PII. Kia's Power Tools and such really come alive compaired to running the same software on an 40-040 Mac.

But the fun factor still goes to the Falcon. It's the one I go to sleep with every night:).

He classifies the entire 80386 series as 32-bit. Probably because every 386
has 32-bit data and address registers. The 68000 had only 16-bit data
registers. The size of the bus is irrelevant to him. Remeber that the 68008
only had a 8- bit databus but most people would still call it a 16-bit chip.

Actually, the 68000 had 32bit data registers. It was the
external bus that was 16 bit.

Well how about it? Can't the best of Atari's OS be ported into the Intel GEM AES? Now that would be a sight! Heck even port Mint's Unix kernal and have a true multitasking OS instead of buggy Win95!

Just a thought...

You mean the Apple PowerMac G3 266 DT with 64M, 4 GB, 56k and MS Office 98 bundle for $1799. Or how about the G3 266 DT bundle with 64M, 56K with DVD/ decoder for $1749...

This is to easy...What you are saying is that you need a wintel box because
the TT can't suit your needs due to the software angle. Thats in stark
contrast to the Atari Jihads who rant that we got it all and who needs a
modern PC(wintel or mac).

He stated that the speed was below common Pentium speeds in the 350mhz+. He
stated that truthfuly. I disagree with his numbers. More like P75-100
numbers.

>

So whats stopping you? You don't have to use wintels and macs...Why being so
defensive? Its just a computer..

> And if I want Netscape, I can easily run and load Linux, compile,
> serve. End of story.

Why? cab not good enough?

> You still haven't explained why you hold up a WINTEL system against
> the Hades instead of a Mac - perhaps because you'll be shown up for an
> ignorant fool again?

Because the letter stated that the Hades was equivelant to a 200-300mhz
Pentium box which the entry level G3's blow it away. No mention of mac
performance. He was making comparison with Pentiums period..

> >The market does not agree with your iMac pricing criticism.

Does that include the Hades as well? Because you can find cheaper wintel
boxes that are faster than Hades for alot less.

Have you told Compaq this? .

Can '10' Tos fans be wrong? The reason is that CompUSA or Apple will not
divulge is for competitive reasons. Apple does not want Compaq to know until
later. I am sure Jobs will divulge at MacWorld next month. I know the comp
numbers I just can't say.

>It's my letter, I can do what I want with it. There was no disclaimers. It
>was not a personal attack since it was entirly posted as is...

read the above again. It was not YOUR letter, it was Edward's
letter TO you. It was meant to be private. You considered it an attack
against you and you did what you did with it, violating nettiquette in
the process.

>> I'm not dodging the issue - seems you are. Why should I want to run
>> a dog operating system like Windows '9x (which you admit is buggy and

>
>So whats stopping you? You don't have to use wintels and macs...Why being so
>defensive? Its just a computer..

then why do you constantly insult the intelligence of all those who
use Atari computers, and constantly printing up FUD? Does this sound
like someone tolerant of all computer platforms? You're the one who
starts the insults by referring to us as a "Jihad" and as "Atari boobs".
Remember too that I DO use a Mac as well.

>
>> And if I want Netscape, I can easily run and load Linux, compile,

>
>And you believe in the tooth farry...
^^^^^

coming from someone who can't even SPELL "tooth fairy". Again, it's
legit.

The fantasy stuff is Apple's claims of superior G3 speed (remember,
it was Steve "arrogant bonehead" Jobs who claimed that an iMac could
"toast a 400 mHZ Pentium"). The graph that Apple uses in the iMac
pamphlet continues with the distortion - it's just three lines with NO
real-world numbers (only with a snail at the head of the one for the
PC)- the same type of graph that Ronald Reagan was criticized for when
he tried to use it to stop a Congress-backed budget from going through.

At least three independant tests were done by PC magazines, and all
three found that Apple is blowing smoke....

>
>I am sure that a first time user who wants to get on the internet in ten
>minutes will shop around for components...
>
>As for building the G3 for less cost is already less...

HMMM, a G3 tower runs at around $ 2500-4000 CDN. I'm sure that if I
could get a motherboard and the rest of the components (graphics cards,
hard drives and the like) I guess I could build it for much less. Too
bad I can't buy the motherboard.....

Nope, you ARE being humiliated. As a matter of fact, any Atarian
who I've talked to in conversation laughs hard whenever your name comes
up. No matter where I've gone in the world, your name comes up and
immediately there's fits of laughter at your expense.

>
>It's a computer not a religion. You are too easy..

coming from someone who treats any Macintosh as a religion. Now
there is true pot/kettle/black.......

I am here after hours

Nope, just stating the facts. In fact, yesterday WAS a good day -
got a lot of shopping done. Even went into a Mac dealer and tried out
Sherlock (they actually had it online - I must say, I am impressed).

I must admit, Linux IS intriguing. We had a TAF meeting on this
back in October, and although the guest speaker didn't arrive (he
must've thought he was going to speak to a bunch of 2600 enthusiasts :))
a former member of the club, Dr. Hugh Redelmeyer, spoke in his stead
and wonderfully explained how Linux could make a big difference. In any
case, right now we have at least two people working on getting Linux to
run on our respective Falcons, and I may take a stab at it if someone
could provide me with the proper resources.

Of course, I can also pick up a SCSI-based IBM PS/2 486 for $99
right now, so that, a CD ROM unit and Red hat and I'll be laughing :)

Unix could use a low power GUI with some apps available for
it. While X is nice, it still has the same approximate bloat
factor as MacOS or WinXX. GEM/svga & GEM/X if done right could
fill a void left by the current insanity in Linux regarding
emulating Windows as much as possible (in app style & such).

No, what's cause for suicidal tendencies is to go
from the flat memory gem that is GEM to a '93 version
of DOS where you need to tell each of your device
drivers where to go into memory because the nasty
(DOS) is still programmed as if it were to be running
on a 8088.

68008 ~ 80386 is quite the appropriate comparison.

yup - that's the ticket !

I can buy a Compaq with 128mb, 8gb HD, 56k and MS office bundle with 15" monitor for about $2,200 (Canadian yet) with a printer chucked in - the Mac G3 similarly equipped, no software and no printer, will set me back about $3,500 Canadian.

The high price of Apple product & peripherals murders the average consumer.

Guess again 'Chunks'....

Comment on the [Macs Only!] Future shop report.

All Future shop stores will be trained the training is being done store by store though so it may take a week or so.

Second like all other retail store the endcaps on
every isle are sold to different manufacturers generally for one
month at a time which means that on Tuesday the
iMac should be in a better place with proper sings.

Third although Computer City Canada has been bought by Future Shop our service will not change. They are commented to running us individually.

As a side not iMac sales are going really well at
all Computer City Canada stores we expect about 100 units to
arrive this week above the 40 we got 10 days ago
this goes for all the store.

To all Macs Only readers please comment on the
Computer City Mac Store and tell us how we can do better

Thanks,
Mitri Dahdaly
Computer City Apple sales specialist

Peter S.

3005. TIFKAS: an explanation of his behavior

Newsgroup: comp.sys.atari.advocacy
Date: 1998-12-05 00:00:00 UTC
From: "Harold R.G. Alley Jr." <ataripc@earthlink.net>

The following is an interesting article about Apple from someone WHO DOES know his facts about Apple. To my fellow Atarians I apologize in advance for the size of this post and the decidedly windows slant. However many of Fred's point would apply in a positive light to Atari's GEM and even Amiga's OS.(Lean superior programs running faster on slower machines then bloated code running on screamers)

It explains in beautiful detail the problem with TIFKAS

Taken From The CMP Techweb site . The Langaletter editorial for this week

Correcting MacMisinformation
(12/01/98; 9:00 a.m. ET)
OPINION
By Fred Langa

Due to a huge number of incendiary posts, many clarifying notes about last weekï¿½s column,"Appleï¿½s Heavy Hand," got lost in the sauce. Here are answers to some of your questions: A record number of people wrote about my last column Apple's Heavy Hand. The column was about a number of Appleï¿½s practices and policies that I found deeply troubling -- deceptive ads, a renewed anti-clone policy, etc.

Much of the e-mail and posts were from Mac fans who felt I had unfairly maligned Apple or the Mac or Mac users. Some of the posted replies were cogent, thoughtful, and asked good questions or raised good points. Alas, hundreds and hundreds of e-mail and posts were just plain silly, scatological or obscene diatribes and personal attacks against me for saying something negative about Apple.

With the enormous volume of posts, some answers to the good questions got lost in the rubble. Please let me correct that here.

"What deceptive advertising?" I said that Appleï¿½s ads about the speed of the G3 and iMac were intentionally deceptive (though legal), and I stand by that statement 100 percent. But large numbers of people wrote to tell me that Appleï¿½s claims were proven by the BYTE Magazine "BYTEmark" tests, which Apple cited in the fine print at the bottom of its ads. (The irony in this is that I was the editor in chief of BYTE for four years. I know what the misquoted benchmarks do and do not do.)

Apple used the BYTEmark tests to create the impression that the G3, in general, and the iMac, in particular, are as fast or faster than top-of-the-line Pentium IIs. Steve Jobs also reinforced this with comments he made at the iMac rollout; he was quoted as saying the 233-MHz iMac would outperform a 400-MHz Pentium II. The one test where the G3 did actually beat Pentiums was BYTEï¿½s low-level CPU integer benchmark. In that one part of the multi-part chip-level tests, the G3 was faster.

Note that I said, "chip-level." The BTYEmark test in question is a CPU test, not a system test. CPU tests are academically interesting as long as you realize that a CPU by itself is nothing; the only thing that matters in the real world is how the

overall hardware and software perform running real applications. Numerous third-party real-world applications tests (NSTL, ZD Labs, PC Worldï¿½) show the G3 systems running real-world applications generally lag behind similarly-clocked Pentiums. There are some areas where a G3 Mac has a slight speed edge, but overall, Macs tend to be a bit slower than similarly clocked Pentiums. So, Apple took a small, almost meaningless sub-test and used it to create the impression that G3s and iMacs have an inherent speed advantage over high-end Pentium II boxes. That Apple wildly succeeded in fooling many people is evidenced in last weekï¿½s posts. But itï¿½s just not true.The ads clearly were deceptive.

"Fredï¿½s in Bill Gatesï¿½ back pocket. Heï¿½s just a shill for Microsoft." If you check the TechWeb and CMPnet's archives, you'll see that Iï¿½ve criticized Microsoft far more than I have any other company. In fact, by amusing coincidence, I wrote the current Windows Magazine cover story called "Win98 Bugs and Fixes."

But some Mac users equate saying anything negative about Apple with being blindly pro-Microsoft --- even in the face of overwhelming evidence to the contrary. Thatï¿½s too bad because it shuts off debate. The reality is that all companies make mistakes. It's not right to treat Apple as a sacred cow. When it fouls up, it deserves criticism -- same as Microsoft, Sun, IBM, or anyone else.

"How does Apple pander to ï¿½ugly emotionsï¿½?" I've only critiqued Apple a handful of times over many years, but each time Iï¿½ve gotten amazingly virulent responses from the Mac community. As mentioned above, after the last column, I got e-mail-bombed (hundreds of duplicate, obscene letters intended to disrupt my e-mail service); and the public-posting area was flooded with writings of incredible hatred and rage.

In marked contrast, despite my frequent criticizing of Microsoft, not once, ever, has even the most rabid Windows fan called me an "Apple shill" or claimed that Iï¿½m "in Steve Jobsï¿½ back pocket." Iï¿½ve also never -- not even once -- received a hate-filled, obscene note from a Windows fan as a result of my criticizing Microsoft. Why is this? Why is it that, unlike users of most other product, some Mac users behave so poorly? Why do some Mac users fail to follow the basic rules of civilized discourse and debate when the subject is Apple or the Mac?

I believe Apple itself is partly to blame. Itï¿½s fostered some of these very bad attitudes among its customers with 10 years of ads telling its customers not that their computers are better, but that they as people are better: They're smarter, more creative, more independent -- they "think different." The implication in the ads is that if you use a Mac, youï¿½ll be like Einstein, Picasso, or John Lennon.

While you might discount as hype any advertising message that claims "you're different; you're better; the normal rules
don't apply to you," some significant number of Mac users seem to have taken it quite literally. If this sounds Far-fetched, look at last weekï¿½s posts: Youï¿½ll see Apple customers believing and behaving as if they're somehow better
then the rest of the world, and that the normal rules don't apply to them. Itï¿½s astonishing: Youï¿½ll see posts filled with utmost arrogance; statements alleging that Mac users are somehow personally superior to users of other operating systems; and more. Many, many of the posts reacted to my critique of Apple as if I somehow were directly attacking them, the Mac users. One user spelled it out in a heated message where he said that criticizing Apple was the same as criticizing his Mac, which was

the same as criticizing a family member. (I am not making this up.)

This level of fervor almost sounds funny when reported as I just did. But I got more than 500 of the most obscene,
disgusting, hate-filled e-mail you can imagine from these same fanatics, and I assure you itï¿½s not humorous at all.
Although anyone who sends e-mail-bombs or posts a scatological, obscene note in a forum is responsible for
his own actions, I do believe the Apple "you are superior, you are different, you are better" ads have a lot to do with
cultivating and pandering to these ugly emotions.

"Youï¿½re insulting to Mac users." I draw a huge distinction between ordinary Mac users who elect to use their Macs for
good reason, and the Mac fanatics who posted the hate-filled, obscene, offensive flames in last weekï¿½s discussion.
These latter are people who apparently cannot tell where their computers end and their own egos begin. They regard any criticism of their choice of computing platform as if it were a personal attack on them, and respond with a personal attack of their own.

Itï¿½s silly and more than a little sad. Computers are supposed to be tools; theyï¿½re not extensions of our persons any
more than a hammer or a paintbrush is an extension of ourselves. As products created by human organizations, all OSes and all hardware contains flaws. Rational people accept that and can discuss the flaws and strengths of their computers and operating systems in a rational manner. But some significant chunk of the Mac user base cannot.

Those are the people I have an issue with, not the rational Mac users. "Tell me one thing Microsoft innovated." How about a successful GUI on ubiquitous, low-cost, non-proprietary hardware? "How can you say OS 8.5 plays catch-up to Windows?" Itï¿½s no secret the Mac OS stagnated for many years as Apple foundered. (One example: Until Mac OS 8.5 the Mac Open and Save dialogs hadnï¿½t significantly changed in years.) In updating the look and feel of the OS, Apple employed many of the features and functions in 8.0 and 8.5 that previously had been available in Windows 3.x, Windows 95, and Windows 98.

For example, the ability to alter the menu bar's type, size, and color; the look of windows, scroll bars, and icons; sounds and animations; anti-aliased text; etc.; all have been part of Windows for years. Other things such as built in system- and Internet searches debuted in Windows 95; and local full-text indexing appeared via free add-on in Windows shortly thereafter. "Live scrolling" and the resizing "thumb" have been in Windows for quite awhile, as have "command-tab" switching between apps, an icon-based palette of running apps, and drag-and-drop printing. Even under the covers, the Mac is playing catch-up in some areas. For example, a Mac now can reliably retain a TCP/IP address across reboots, and finally show up properly in DHCP lists; Windows has done this for years. Thereï¿½s more, but you get the idea.

Thereï¿½s no shame in borrowing a good idea. I donï¿½t know why some Mac users have such a hard time with it. Itï¿½s
especially baffling in light of the fact that all the most important, core elements

of today's GUIs (windows, icons, mice,
pointers, WYSIWYG text, etc) actually originated at Xerox in the Alto, which
predated the Mac by fully 10 years;
Apple borrowed these ideas, and built on them. When the Mac appeared, Apple did add
many refinements and also did a great job of packaging them. (We'll charitably
ignore the Lisa). The volume of Mac sales did change the face of computing, and
thatï¿½s something for which we all owe Apple a debt of gratitude.

Later, various versions of Windows obviously borrowed many features from both Xerox
and Apple. And today: Mac OS 8.5 borrows a number of refinements that appeared first
in more recent versions of Windows. So? Whatï¿½s to freak out about? Neither Gates nor
Jobs is a dummy; they each know a good thing when they see it, and they're not
ashamed to borrow ("steal" is the word many Mac people use) a good idea. All
companies crib from each other. Why is it so hard for some Mac users to accept this?

"Your article is based on opinion." Yes, exactly right. It was an opinion column. It
was clearly labeled as "opinion" in its header, and it resided in the "opinion"
section of TechWeb. It was not a review or a news story, and it wasnï¿½t presented as
such.

"Your entire [Apple is anti-clone/OS 8.5 upgrade bug] case rests on 1,000 reports of
damaged hard drives." Not
exactly. Apple did effectively kill off its system cloners; and it does maintain an
"Apple only" support policy. Apple is
demonstrably very clone-hostile.

Be that as it may, the Mac OS 8.5 upgrade-bug situation was less clear when the
column in question was written
(almost three weeks ago). At the time, the upgrade problems on clones were being
reported in ways very similar to mine in online forums and in places like the Boston
Globe's technology section. Even a very positive review of Mac OS 8.5 in Federal
Computer Week said "Several bugs have been reported ... ." The most fearful has been
the hard drive ï¿½kiss of deathï¿½ bug. Apparently, users with clone-based Mac OS-based
systems have experienced hard-disk data loss after upgrading to Mac OS 8.5." My
column suggested two ways to view these upgrade problems. One of them,
which I clearly labeled as an uncharitable view (not as a proven fact), was to see
it as an anti-clone sin or commission or omission by Apple. I certainly wasnï¿½t alone
in this speculation. For example, a well-known, nationally-prominent Mac columnist
(to whom I promised anonymity, so he wouldn't get flamed by the fanatics) confided
to me at the time that he thought the upgrade bugs were indeed a ploy by Apple to
create fear among users about using third-party upgrades in Macs. But since then,
the reports did top out and were not as widespread as they looked like they would be
three weeks ago. Iï¿½m now perfectly willing to concede -- and am greatly relieved --
that the upgrade bug was just that: a bug.

That, of course, changes nothing about Appleï¿½s overall hostility to clones, but it
does put the upgrade problems in a very different light. And Iï¿½m very, very glad it
does.

Unless the 68008 is something more than a 68000 with an 8bit
external bus, than it does infact have the bits that do matter:
support for an MMU as well coprocessor support superiour than
the 386 (8).

Multiprocessor mainframes have been built around 68000's.

The 68000 does have a 32bit address bus, FPU support (My old A1000 had an
FPU and a 68000 and was 100% supported by the 68000 and the OS from day
one.). An external MMU could be implemented, and often was on the old
multiprocessor servers. The overall efficiency of the 68000, not to mention
versatility still means it's a competitive processor to any 386 IMO.

<<content snipped>>

A very interesting, cogent and highly intelligent read indeed. I greatly appreciate the level of consciesness and the subtle touch. While indeed a bit slanted towards Windows and such, it does give a balanced perspective towards borrowing or "stealing" ideas from eachother.

I would have placed things in a different order however. I agree with the statements on Xerox 'GUI ideas, but the read continues with Apple borrowing from Windows. Later on, it justly says that Windows first borrowed from Apple, and that it was in its later years that these roles got reversed.

I am however, very glad, that the Atarian and Amigan or Commodorian fanatics are often people who did make a "rational choice". Yes I know, we have flamers and bombers and haters among us as well, but then, doesn't any society? It is my humble experience however, that at least most Atari users are not as flamy as some of other platforms, in fact they're pretty helpful among eachother (introvert) as well as to non-Atarians (extrovert) and self-criticizing where it comes to the company that created their machines or the machines their clones are based or inspired upon.

As for Windoze people not throwing out hatemail, I guess they probably doon't really care about "opinion", being part of the mass community of Windows users, although I don't want to place this as an overall statement "about Windows users". I just realize that as long as they get what they want, they don't really care about small f(r)actions. It's all politics really.

All in all, I'm glad our Atarian world is a bit more balanced than some of the worlds that surround us or cross our paths.

Having said that, I'll turn in.

What bits are you talking about?

> support for an MMU as well coprocessor support superiour than
> the 386 (8).

The processor provides no support for this; the 68020 was the first to support F-line instructions. So tell me how 68000 copressor support is superior than that of the 80386.

> Multiprocessor mainframes have been built around 68000's.

I know, the Butterfly computer, for example, used 68000 processors. But I don't see how the point is relevant. Of course, if it is, just remember that the iPSC used 128 80286 processors

The 68000 did not have support for copressors. The manufacturer of the system had to hack them in. The 80386 provides coprocessor management instructions (just like the 68020) and a built-in MMU (just like the 68030). We can easily test your last statement; let's design a benchmark for the two processors and see which one comes out on top. We'll use an Atari and a 386-based PC. The 68000 should even have an advantage because I don't recall it having any memory wait states in Atari hardware.

Hmmmmm, when did this happen - personally, the 'Futile Shop' chain is the one place in which never to buy anything.

The 'service' is lousy, the staff generally quite ignorant - and - or - misleading.

On the other hand, the 'Computer City' people I have talked to here, not only seem to know their stuff and not one of them has ever slagged the Atari platform - in fact one individual was even quite helpful.

So if Computer City is to become another 'Futile shop' - I'll need to find another supplier of 'goodies' !

Hello everyone!

I have the following atari Compute's books for sale:

"Compute's first book of atari graphics"

"Compute's second book of atari graphics"

"Compute's first book of atari games"

"Mapping the Atari, 1st edition"

All of the books are in good condition and are priced at $10.00 each
plus shipping. I would suggest the 3 day shipping as it is only $3.00
and gets the books to you quickly at a reasonable price. Please e-mail
me if you are interested in any of these. Thanks!!

Guess again, TIFKAS - I happen to see the Future Shop ads.

Guess which computer is NOT prominently featured in any of their print ads.

Also, guess which computer is NOT prominently featured in the new "Recommended Gift Catalogue" that just came out this week.....

But, guess which computer was recently featured in a review in the Toronto Star's "Fast Forward" section - and was roasted for being underpowered (he wasn't fooled by Apple's Steve Jobs Reality-Distortion Field either) as well as its lack of a floppy drive, its dearth of software.....

Also, in the recent "Computer Paper", this comment was made - that Apple would rather people think the iMac be like the new Volkswagen Beetle, while its detractors rather see it being more like an AMC Pacer (1)

Oh, yes, did you see the recent review of the iMac in Newsweek's annual computer guide? Certainly was a glowing review - NOT.

Still waiting for your take on my rebuttal to your FUD on the Hades - COWARD.

1) a car made by the late, great American Motors that was also, like the iMac, a rather neat design - and, like the iMac, noted for being underpowered. If you've seen the "Wayne's World" movie, this is the car driven by Garth (Dana Carvey) in the "Bohemian Rhapsody" scene.

You must not have seen PageMaker, Photoshop, and Director perform on a G3
like I have had compared to similar clock speeds on the wintels. Being an
Apple Power Rep on CompUSA duty affords such things and part of the arsenal.

MS Office Apps run faster on P's. Gee I wonder why..

that's because you have yet to have sat down in front of a TOS
machine for the second time, AIRC you've stated you've used an ST a
grand total of ONCE.

and believe me, they exist. Calamus '98, Apex Media, Smurf,
Positive Image II. Go like stink under an "underpowered" Hades with a
non-bloated operating system.

Learn to spell "equivalent".

^^^^^^^

Hmmm, in the same article he mentions he was a former editor for
BYTE, and knows how BYTEmarks works - read the above again, weinerhead.

And he knows that Apple deliberately fudged their figures, as confirmed by at least three independant tests from other sources, including PC World.

Look who's trying to dodge the issue.......the same guy who can't spell "innuendo". Must've caught a brain virus from Roger The Sad Sheppard.....

>

> the 386 (8).

68008 has:

8 bit data bus (68000 = 16 bit)
16 bit ALU
20 bit address bus (1 MB address limit) (68000 = 24 bit = 16MB)
32 bit data/address registers
(Sorry - I don't recall the on-chip data path width prob. 8 or 16 bit)

In essence, it was a "budget" 68000.

The 68010 (1983) could support a 68451 base/bounds MMU, but full
coprocessor support didn't arrive until the 68020 (1985)

Then make sure to clock them right. But a 386 vs a 68000 is not fair. You
should test 80386DX with 80387 versus 68030 with 68882 at the same bus and
processor clock speeds.

>

Well we have seen Cubase and Calamus on Wintels and on Macs, compare that to their ORIGINAL Atari equivalents.....

Look, Mr. S., we can strike you with as many "facts" as you can strike us. So if you in fact claim that these Photoshop etc. apps perform better on

Macs, gee I wonder why... ;-)

Probably the same reason why Cubase and Calamus run best on Ataris.
The same reason why MS-Office runs best on Intels.

And you are contradicting yourself in a very hypocritical manner. How so?
You criticize other platforms on evidence like "look on Wintels MS-Office
runs better than on the Mac" but at the same time you say "look on Macs
Photoshop runs better....

That's not a fair comparison in either way. FACTS, FACTS, FACTS, Mr.
Sinclair.

>>
>> "How does Apple pander to ugly emotions?" I've only critiqued Apple a handful of

>
>Thats because you do not have the facts on your side..Just inuendo..
In fact he does. But facts can be interpreted and twisted in many many ways. Apparently, you haven't read the whole posting. He clearly balanced and backed his opinion with his knowledge of the byte tests and also stated that Apple used ONE area of the multi-part test as "proof". Now I'd suspect that that is not entirely factual either, although it's perfectly legal and interpretable as such and everything, but still remains deceptive given the nature of these tests.

Excellent, I was attacking the statement that "The overall efficiency of the 68000, not to mention versatility still means it's a competitive processor to any 386 IMO." Since we agree that this statement is false, I can move on.

...it depends on what you're running on it...

If the 386 is also running GEM, then it's a fair
comparison. Otherwise, comparing the 80386 to
anything more than a 68000 is an unfair comparison.

The 80386 suffers from everything else that will come with it.

Whiteline CD Bundle #5
Our fire-new CD KAPPA + CD from the Bundle a #2 of your selection (Alpha-Gamma-Delta-Omega-Psi-Substance-Complete MiNT 98 or Selected Signs) Complete package price: only 99, - DM(90$Cdn)
kappa
On kappa the CD find you among other things: 15 registered, licenced full versions: STarCall pro; Disk index; Egale; Organiser; Smurf Silver edition; Clix; PacShell; MultiStrip; TWSM/2; Music Edit light; Cairo; Face Value 2.0; Verthor; Adamas light off-lines; Resource master 2. Further: 500 fire-new Calamus Fonts; NetBSD 1.3.2; GNU C++ 2.8.1; over 3200 new types of tie-clip; new plays, data bases, hypertexts, demo, music programs, sound files, diagram programs uvm. ;altogether more than 650 MB Atari software.
Our price: 69, - DM(63$Cdn)

Whiteline CD Bundle #2
Alpha -- Gamma -- Delta -- Omega -- PSI -- Substance -- Complete MiNT 98 -- Selected Signs
2 CDs of your selection from this Bundle only 99, - DM(90$Cdn)
alpha
The classical author under the Atari CDs. On the alpha CD you find among other things: The registered full versions:
Poison! - the anti-virus program; Before Dawn - the display bildschirmschoner; Boxkite - the Fileselector and the invoicing director of customer. Further: The complete DL PD series; 200 Signum! Fonts for all printers (9/24/Laser); 500 True type Fonts for NVDI; 300 GDOS Fonts

for display and printer; 500 Calamus Fonts; Programming languages and Tools; more than 100 plays (colour and mono chrome); each quantity of Tools, utilities and applications!; altogether more than 500 MB Atari software.
Our price: 59, - DM(54$Cdn)
gamma
On that you find gamma CD among other things: 8 registered full versions: Poison! - the anti-virus program!; TurnUs - the file archivist; 1stGuide - the Multitool; Rolfi - the postal zip code administration; Original - the B. Dash clone; Lazaz - packman-brightly; LDP - the character program; Easy PGP - the Cryptotool. Further: 1000 new Calamus Fonts; 1000 new True type Fonts; The complete DL PD series; Programming languages and Tools; 130 MB Falcon demos, Games & Tools; and much more besides; altogether more than 650 MB Atari software.
Our price: 59, - DM(54$Cdn)
delta
On the delta CD you find among other things: 10 registered full versions: CyPress - the text processing; Kandinsky - the vector character program; Bellini - that pixel mark program; Procurator 2 - the modular data base; Music Channel - the D-CPlayer; Printing press - the print program; MAdress - the address administration; Chaos Ult. - the Fraktalprogramm; C.A.G. - the multi-character program; Graph cousin - the picture data base. Further: 800 new Calamus Fonts; 800 new True type Fonts; Linux/68k ALD standard design; new plays, data bases, hypertexts, demo, music programs, sound files, diagram programs uvm., altogether more than 640 MB Atari software.
Our price: 59, - DM(54$Cdn)
omega
On that you find omega CD among other things: 8 registered full versions: JAnE - the ultimate text editor; 1stGuide - the Multitool; Vesal - the versatile tutorial; Procurator 2 - the modular data base with new modules; Chronos - the date planner; GemView - the Grafiktool; Last day of the month - income - surplus - calculation program for small to middle enterprises; Director of customer + - the professional version of the good invoicing with stock management and info. post office. Further: The complete DL PD series (188disk) freshly updates (with very many updates); the complete GNU C++ 2.7.2; type of tie-clip purifies 3000; 500 Internet diagrams; extensive Internet and on-line file; Linux/68k ALD standard design; Povray 3,0 complete file; more than 50 new plays Multimedia; totally (animations, sounds and visions) and much more besides altogether more than 600 MB Atari software.
Our price: 59, - DM(54$Cdn)
psi
On the psi CD you find among other things:11 registered full versions: Stella 2 - the document data base for the administration, manipulation and display of any data; GemView 3 - the outstanding View and conversion program for pictures of all kinds; Kandinsky 2,5 - the reference of the vector character programs; F-copy per - the copying and archiving program of the superlative; Thing - the first-class and

Desktopalternative up-to-date; GeoCAD - geographical map design of the finest one; Play it again, IN ACCORDANCE WITH! - the GEM Spielepaket with4 different plays; Almost second gate Backup - the Backupprogramm for all Atari computers; DaCapo - the extensive address administration with serial letter function; GEM Installer for Linux/68k - for very easy Linux installation on push of a button; TurnUs - the ingenious file archivist. Further: 500 fire-new, high-quality Calamus Fonts (with umlauts); Linux/68k ALD complete version; NetBSD 1.2.1; more than 50 new plays; more than 200 MB Tools, utilities, applications, sound, diagrams etc.and much more besides altogether more than 630 MB Atari software.
Our price: 69, - DM(63$Cdn)
substance
The Substance CD contains the following public domain series in packed form: GFA BASIC club series(191 diskettes) Delta lab DL series(193 diskettes) ST vision series(484 diskettes) Atari journal J series(335 diskettes) Atari journal TT series(9 diskettes) Atari magazine series(116 diskettes) Contrast 7000er series(50 diskettes) PD pool 2000er series(330 diskettes) HSN sound files series(53 diskettes) Calamus Font series (87 diskettes) altogether approximately 600 MB Atari software in ZIP files, inclusive file BBS files for the application in mailboxes and the descriptions of all programs.
Our price: 59, - DM(54$Cdn)
complete mint ' 98
On these CD are all at present available MiNT�Tools! complete X11; LANGUAGES: PERL, HUGE, TCL, GNU C++ 2.7.2; Complete MiNTOS; MiNTNET; All Internet Tools: Gopher, WWW, ftp, telnet etc.; All MiNT distribution kit; Further the complete MiNT course from the D-CMagazine is contained of revolution.
Our price: 59, - DM(54$Cdn)
selected signs
High-quality Fonts in all usual formats finds you on our Selected Signs�CD.
Among other things all CFN�Fonts of all Whiteline�CDs, everything ever appear-ends GDOS Fonts and a rich selection of beautiful True type Fonts, which transmits also with NVDI. In addition Fontutilities and Bearbeitungstools u.v.m.
In points of pass: more than 3000 Calamus Fonts (very many unpublished); more than 1400 True type Fonts; more than 600 GDOS Fonts; many Font Tools and utilities!
Our price: 49, - DM(45$Cdn)

Whiteline CD Bundle #3
Linux/68k complete package: 4 CDs with Linux/68k 2,0 + updates 2,2 + SOURCES + Resources
Complete package price: only 129, - DM(107$Cdn)
linux/68k 2.0
On these CD find you the complete Linux/68k with the Kernel 2.0x version for Atari, Mac and Amiga. In addition a multiplicity of efficient programs, the graphic user surface X11 and those KDE - beta 3 Unix Desktop version. Many diagram programs, Games, sound programs,

Matheprogramme, text processings and wordprocessors, Internetbrowser and Tools, and much more besides.
Our price: 79, - DM(72$Cdn) In the Bundle with the Linux/68k Sourcen CD only 99, - DM(90$Cdn) (instead of 118, - DM)
linux/68k 2,2 updates
On these CD find you that Update 2,2 the Linux/68k 2,0 CD.Additionally all current versions on the Linux/68k 2,0 CD available application programs. This CD is only in connection with the originals Whiteline Linux/68k 2.0 CD usable.
Our price: 39, - DM(36$Cdn)
linux/68k 2,0 sourcen
On these CD find you all Sourcen to that Linux/68k 2,0 CD.
Our price: 39, - DM(36$Cdn) In the Bundle with the Linux/68k 2,0 CD only 20, - DM (18$Cdn)
linux/68k 2,0 resources
Many useful Tools, utilities and programs for Linux/68k 2,0 the inclusive pertinent Sourcen. (no overlaps with the Linux/68k 2,0 Sourcen CD!)
Our price: 49, - DM(45$Cdn)

Whiteline CD Bundle #1
Propaganda -- Erotica -- all about Signum! -- transmission -- MacAlpha -- Atari Forever of volume of 1
3 CDs of your selection from this Bundle only 69, - DM (63$Cdn)
propaganda
Here everything turns around hypertexts. A number of giants of these attractive info texts to all only conceivable areas of the knowledge. Fast look-up and access functions distinguish this system. Naturally also the newest versions of ST Guide and 1st Guide.
Our price: 29, - DM(27$Cdn)
all about signum!
Everything which one for the daily use of the legendary text processing for ATARI computer is necessary on these CD. 600 Signum!2 Fonts for all printers 100 brand-new Signum!3 Fonts for all printers Tools & utilities for Signum!
Our price: 49, - DM(45$Cdn)
transmission
On the transmission CD for the Atari Falcon030 you find among other things: 2 registered full versions: (all Falcon only!) Golden Iceland - the popular strategy play. More turbo-brightly - the display bildschirmschoner. Further: the demos of the Fried bits 1.2 and 3 Coder party; each quantity of Falcon Games; almost all otherwise appeared; Falcon demo! ; Music and diagram programs, Tools, document, sound, pictures, animations u.v.m. altogether more than 500 MB Atari Falcon software.
Our price: 29, - DM(27$Cdn)

3025. iMac beats pants off Pentiums!

Newsgroup: comp.sys.atari.advocacy
Date: 1998-12-07 00:00:00 UTC
From: sinclair2246@my-dejanews.com
Message-ID: <74fboo$dm2$1@nnrp1.dejanews.com>
Source record: 4086

From Don who uses PC's and Macs daily...Thats real world testing..Not Mr. Langa who'm does not use a G3 which translates into no factual credibility not to mention PC World and PC Magazine who have a lot to lose..

"The Rev B iMac"
Fresh Crabb, 12/7/1998

Crabb&#65533;s Bottom Line Power Macintosh iMac, Re.v B The Goods: Faster and cheaper than the first iMac Rating: 9.5 Vendor: Apple Platforms: Mac OS URL: http://www.apple.com Phone:408-996-1010 List Price: $1,299, as low as $1,199 street

In Short: ""You want an
inexpensive, fast, plug and play home PC?
This one's it.""

Apple Computer, riding the wave of popularity set by its innovative and inexpensiveiMac home computer has given potential iMac buyers a gift for Christmas -- iMac,revision B. The new iMac,which still lists for $1,299,can be had for at little as $1,199 at some stores, and can also be purchased via the new Apple Loan program for a mere $29.99 per month -- a real gift for those of us on a budget.

The revised iMac still sports a 233MHz G3 PowerPC processor, making it more than twice as fast as the fastest Pentium machine in its price class (the 233MHz Pentium II), and close to the speed as the fastest 450MHz Pentium II that lives in $2,500 Windowsworkstations. The revised iMac finally gives a realvoice to Apple's ThinkDifferent ad campaign.

The revised iMac also
looks different than its Pentium Wintel
competition, because it
is different. Besides its alternately funky
and snazzy translucent
white and teal plastic case, contoured
Euro-look mouse and
keyboard, and built-in handle (remember
the original Mac?), the
iMac is jammed with technology that
belies its price.

Consider its fast 233MHz G3 CPU with 512KB of backsid eL2 cache that easily beats theWintel competition.

Consider its two 12Mbps Universal Serial Bus expansion ports, 32MB of SDRAM,expandable to 160MB, 4GB EIDEhard disk drive, and 24XCD-ROM drive -- all equalling or beating the Wintel competition, plus its 56Kbps modem for fast Internet connections, hence the name,iMac. The machine runs on a 66MHz system bus (fast for a Mac), which also adds to its speed.

Consider its 4Mbps infrared (IrDA) port for quickconnections to digital cameras, printers, or wirelessnetwork hubs. Or its built-in SRS surround sound stereospeakers flanking its high-res 15 inch color monitor (1024 by768 pixels), plus built-in fast 10/100BASE-T Ethernet networking jack. And don't forget a software bundle offering Quicken 98 Deluxe,Internet Explorer 4.0 Plus,AOL 4.0, AppleWorks (formerlycalled ClarisWorks), and a nice bunch of utilities,games, and eduware including Kai's Photo Soap, Kai's PowerGoo, and Disney's Animated Storybook.

The revision B iMac also ups its video RAM complement to 6MB working in an ATI RAGE Pro 3D card which really juices graphics and 3D gaming performance. To further speed things up and improve reliability the iMac B now comes with Mac OS 8.5 -- which is much more reliable and a tick or two faster than the Mac OS 8.1 that shipped on the first iMacs.

The new iMac still lacks a floppy disk drive, although you can buy a third partydrive from Imation for $149the reads and and writes regular 1.44MB floppies, plus 120MB SuperDisks.

The iMac also lacks any expansion slots, since it's made to be a what-you-buy-is-what-you- get machine. And unlike other Macs, the revised iMac does not offer a Small Computer System Interface (SCSI), for connecting to any existing SCSI external devices you might own, although you can buy an adapter (the Microtech Express USB for $79) that lets you plug your SCSI devices into your iMac's USB ports.

Although Apple only started selling the original iMac in August, universities got interested in the machine as a required or suggested back-to-school computer for their students very early. Dartmouth College of Hanover, NH, for example, recommendedthe iMac for its entering Class of 2002 as the ""preferred computer forincoming students.""

The College believes this system represents the best choice formost students, after having weighed such factors as cost, performance, and projections for long-term utility in the Dartmouth environment. The recommended package has enough computing power to be useful in Dartmouth's present and future computingenvironment. ""It is well suited to the electronic mail, wordprocessing, information access, and graphics tasks that dominate Dartmouth student use of a personal computer,"" said Dartmouth in awelcome packet to its freshman class.

The revised iMac performed very well in my tests, providing, as promised, a one-click connection to the Internet. Setup took about as long as removing it from thebox, plugging in the powercord, keyboard, mouse, and modem. Compared to Compaq Presario, Gateway, and HP Windows-based family PCs priced nearly identically, the iMac was a breeze to setup and use for the first time.

With its newly improved
video performance, lower price, low
price loan program, and
core value, the iMac from Apple
remains a Crabb's Best
Buy.

We've been talking about the chip not the system that the chip is found in but
we can move on if you want...

> Otherwise, comparing the 80386 to
> anything more than a 68000 is an unfair comparison.

That's interesting. How does linux run on a 68000? It runs quite nicely on a
386. Same with QNX. Or is GEM the most important part of any software system?

> The 80386 suffers from everything else that will come with it.

What comes with it? Are you talking hardware or software?

I disagree. I would scale things like this:

286
68000
68010
68020 and 386
68030
486SX
68LC040
486DX
68040
486DX2
68040 double clock variety
Pentium
Pentium MMX
Pentium Pro
68060
Celeron
K6
Pentium II

Based on CPU specs themselves where bitness outweighs features such as MMX
or an MMU.

I partially agree. A 386SX vs. a 68000 clocked at the same rates CAN come very close. Ofcourse, that would mean comparing a 68000 @ 16MHz to a 386SX (yes the SX is important in this) @ 16MHz.

And the results of that comparison heavily depend on the importance of various factors, such as either bus efficiency or use of an MMU. It really depends what is more important.

So, yes, from the technical point of view, we agree. But that doesn't mean an inferior processor or an inferior system in terms of processing power, can not be competitive. (Yes I know, you didn't say that, but I just wanted to make sure we're on the same wavelength).

Linux is not a fair comparison either. As we all know, it REQUIRES an MMU, which is built into the 386 internally and higher, as well as in the 68030 (subset of 68851) and higher (supersets of the 68851). The 68020 can have one 68851 added externally.

So that would be the basic system. You could compare Minix though....

Yes it does. BUT, erm does this have anything to do with the issues at hand here? If you'd like we could discuss other issues as well.

:-)

Doing anything serious with QNX will require considerably
more resources than GEM will. Even that spiffy QNX demodisk
runs into certain limitations (like not booting some PCs).

Depending on how heavily core is being used, the MMU
may or may not be an issue. People are still trying
to find something generally useful to do with MMX so
the lack of it is hardly a reason to knock a micro-
processor.

Certainly, for the kinds of uses that WinVocates and
MacVocates like to state for their pedestrian userbases
an MMU is certainly overrated.

Just for you 'Chunks'..and yes they do have just rev. B iMacs..

---------- Positive FutureShop Report -- Halifax, NS: From reader John Christie, " I went to the local Future Shop (Halifax Nova Scotia) to check out the iMac this weekend. I couldn't stay long but my initial impressions are generally more positive than expected. Future Shop locally has generally had a terrible history with Mac products. I had no qualms about them dropping the Mac a while back because they were doing more harm than good with their disparaging attitude. However, this weekend I found something quite different occurring. They were actually overselling the iMac and exaggerating its capabilities. I listened to one customer ask about peripheral capability and the salesman gave blanket assurances that you can use the same peripherals as with PCs, no exceptions. And he seemed genuinely enthusiastic about selling the machine. I wonder if the spiffs are happening in Canada too? This was a regular Future Shop sales guy and from the way he attempted to demo audio CD's he seemed familiar with the Mac but not a guru or fanatic. They had an end cap display before entry into the rest of the computer section. It was an iMac/B attached to their top of the line computer sound system running the Tomb Raider 2 demo. The demo looked fabulous in high res. and anti-aliasing on (other than lighting I've never seen a system it looked better on). There were no Apple banners but it was surrounded by stacks of iMac boxes. For the 15 minutes I was in the store there were never less than 4 people trying to get a peek at the machine. NOTE: While in general I had seen salesmen steer people away from Macs when Future Shop had them in the past, I had found that coming in when they were not busy and playing with the machine like I knew what I was doing always attracted the interest of at least one employee. I worked on a Umax/180 for over an hour at a Moncton Future Shop and basically gave a tutorial to 2 of the sales people there. They were genuinely interested and reinforced a belief that much of the Future Shop problem was/is ignorance rather than bigotry. This is further reinforced by the fact that Future Shop is often very unknowledgeable about PC's too. If it was bigotry that would be less likely."

That's not a relevant comparison. Design compromises may have to be made to
support higher clock speeds.

> And the results of that comparison heavily depend on the importance of

> depends what is more important.

Forget about the MMU and the 386 is still better.

Actually, I'm not sure how the 68000 can be considered competitive.

They're at least equally powerful - Calamus was the very first DTP app on ANY platform to feature a built-in softwarebased RIP.....

Have you taken a look at the list below?
The music studio apps on TOS machines used to be, or still are MORE powerful than their Mac varieties AND they were there first.

NO NO NO NO NO - It's your business to SELL SELL SELL.
Like I said before - you state "Gee I wonder why" about Microsoft Office on the Mac (speed and feature comparison) but at the same time you hypocritically make an equally weak and unfair comparison with Photoshop, PageMaker et al. For those apps, Windows users could say "Gee I wonder why". The same reason you could say "Gee I wonder why" on Ataris.

If you don't like the MS-Office comparison, your comparison of Photoshop and other apps DOES NOT hold up to scrutiny. Wanna go to court on this?

>
>It's also true that MS has enginnered Office 97 to perform better than Office

>> posts - oh, but then they would be completely blank :)
>
>I deal in facts..Such as Atari was headed to heavan despite jagflop...Being
>rediculed because I was right...
No you don't deal in facts. You deal in TWISTED facts and IGNORANCE. You try
to sell other people's souls to another platform by bashing the one they own
now. Well guess what... it's NOT working. Selling doesn't work that way, no
matter how many quota you match. I guess the iMac must be for all those
people like you who don't understand one bit of anything that has a the word

"computer" in it. Do you know how to program your VCR? Oh I forgot... there is no step 3. Just put it in the box, bring it back to the store and say you're too stupid to own a computer.

Look - the above is an exaggeration of your level of debate. Please don't judge people that you know not a thing about and one more thing: you're not going to increase your sales by trolling this newsgroup. Find someone else to sell your hypocritic double standards to.

Hmm I wouldn't mind to see a test by a Mac magazine either. But with a fair
comparison of apps which did not originate on the Mac. Maybe Cubase Audio or
Logic Audio (both originated on the Atari, btw) on both machines put to the
test.
>

Well, we don't want that in ten minutes. We want to USE our computer for
other things first. Oh and eh.. don't you think ten minutes is a bit long?
Even compared to W98....
I get on the Internet less than 5 SECONDS after I configured a dial-up PP
connection (which took about 1 minute) on a Wintel system...

OS8 - requires at least 32mB to run. TOS 4 - 512kB. Even MagiC
requires just at least 2 mB to run. I call that "bloat".

>
>> Learn to spell "equivalent".
>
>Will do at the same time when you kiss a girl the first time...Does not

>
>What makes you think what Fred states is face value?

Fred is a professional writer in the computer industry - and he was
former editor of BYTE. AND he knows how BYTEmarks work as a benchmark,
and how Apple fudged the tests. What part of that don't you understand?

I note YOUR writer claims that iMac Rev B. "beats the pants off a
Pentium 450" (my my, the bar has gone higher than even the Jobs
Reality-Distortion Field® did the first time), but doesn't post
collaborating numbers or tests results, or even what tests were
performed so they came to that conclusion. A sign of a poor writer.

As usual, dodging the issue.

>It's a fact that apps like Photoshop, PageMaker, Director and so on perform
>as much as twice the speed of the same Pentium clock speed. Even the PC
>staff admitt that the G3's excell in performance.

and it's a fact that tests performed by three separate sources say
that you're wrong. It's ALSO a fact that you're as dumb as a tree when
it comes to any aspects of computers (remember when I reported a web
site you were spamming us with came up a "404", and you sneered that I
needed a new web browser? "404" means the ISP couldn't find the web site
- nothing to do with the browser.) To the point that you have to make
up FUD about Ataris and TOS....

3043. here's the facts on iMac speed

Newsgroup: comp.sys.atari.advocacy
Date: 1998-12-08 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <366d46f8.0@nemo.idirect.com>
Source record: 4007

since TIFKAS is still running around in la-la land among the elves
and fairies and frogs in funny hats, swearing up and down that the
iMac's G3 processor is faster than a 450mHz Pentium II, it's time I
figured that he needs to be brought to earth.

Here's a VERY interesting post - complete with URLs - of a debate
going on about the PC World tests between a Mac user and a PC user on
comp.sys.mac.advocacy . It gets technical, but it's extremely
well-written, especially from the PC user's point of view, and raises
some excellent points.

TIFKAS may wish to copy this out and give it to his fellow
underlings at the InCompUSAs he frequents.....

derekc@spamrat.filler.to.remove.frontiernet.net (Derek Currie) wrote:

>In a typically desperate attempt to prove Apple wrong PC World concocted a
>totally pointless and biased set of tests comparing:

Before making all your baseless claims, why didn't you go to Packard
Bell's web site and look up the details about the Multimedia 945?
(http://www.packardbell.com/products/98models/mu945.asp)

>1) the iMac, with a 233 Mhz G3 cpu
>
>2) Micro Express MicroFlex-c400A, with a Pentium II-400
>
>3) Packard Bell Multimedia 945 with a Celeron-333
>
>First check out the Mhz comparisons. Look stacked much? Right off the bat
>they look scared. Why not compare 233 Mhz PC machines with a 233 Mhz G3
>Mac, eh? I know why: The iMac would blatantly beat its butt.

I don't know why we have to keep explaining this one. There are at
least 2 reasons to make such comparisons. First, the Celeron system
costs less than the iMac. Most people compare systems on price, so
that is a reasonable comparison IMO. Second, Steve Jobs himself
invites the comparison between the iMac and the 400 Mhz PII. I quote:
"The iMac for $1,299 toasts the fastest PC money can buy at any

price--the Pentium II 400," said Steve Jobs, Apple's interim CEO. ..."
(http://www.apple.com/pr/library/1998/aug/13fast.html)

>And then lets
>consider their price comparison argument: do their PC machines at such low
>prices include 100 Base-T Ethernet? Nope. Infrared networking? Nope, in
>fact no networking at all.

>6 MB of VRAM? Nope, only 2.

When they tested the iMac it only had 2 MB of VRAM and had the Rage
IIc board compared to the Rage Pro in the Packard Bell. So, you say,
the iMac is better configured now. True, but so are PCs.

>512 K backside level 2 cache? Nope, only 128K non-backside cache.

LOL! The 128 KB of *on-chip* L2 cache is much faster than back-side
cache. Depending on the application, larger may be better than faster,
and vice versa.

>USB? Apparenly Nope.

Do some better research. Of course it has USB.

>56K modem? Apparently Nope.

Yes

>Dual headphone jacks? Nope.

If that's important, spend $5 (if that much) on a splitter cable.

>CD-ROM drive of any speed? They don't say.

They don't say because it's obvious that it does. How can you install
most software without a CD? For the record, it has a 32X CD-ROM which
is faster then the iMac's 24X.

>All-in-one portable? No way!

True

>Runs both Mac and PC software? No Way!

Mostly true (there are some 68K emulators), and also mostly
irrelevant.

>Next are the applications they chose, hilarious:

>1) Megalosoft Excel and Word 97 on the PC and Excel and Word 98 on the
>Mac. Yeah right, like Megalosoft ever cared how fast their software ran on
>a Mac. Any child familiar with Macs and PCs will tell you Megalosoft's
>software has been running slower on the Mac for AGES! Some test. Totally
>worthless.

I guess that's why it is one of the best-selling software packages for
the Mac.

>2) Photoshop 5 on a 5 MB and 20 MB image. They don't bother to provide any
>details here, they just say "we applied filters and effects, followed by
>image resizing and color conversion operations." Really. Why? NO ONE

>is a fact: Intel went to Adobe and had them rewrite a number of their
>filters to use acceleration built into Intel chips. Sadly Adobe never
>bothered to rewrite the same filters to be native for G3 chips. Again, the
>test is totally worthless.

So what do you suggest?

>So here we have a stacked set of test, and wowie wow, the iMac lost. Big
>surprise.

What would you suggest as a fair test?

>And to really show off their evil look at what they say:
>
>1) "the world can't make up for slow application performance, poor
>sound quality, and no upgrade path."

How does that make them evil? Is everybody that thinks the iMac is
overpriced and underpowered evil?

>The slow applications are only the apps THEY CHOSE as faster on the PC in
>the first place.

So, contrary to many other Mac advocates, you are claiming that
Photoshop runs faster on the PC than on the Mac?

>The "poor sound quality" is better than any consumer level add-on speakers
>you can buy. Nice try.

It's true. Have you actually listened to the sound on PCs priced at
or below the iMac price?

>The "no upgrade path" they refer to is the monitor. Duh. The iMac is a
>portable all-in-one computer, with what PC World admit is a SUPERIOR video
>quality "yielding even focus and sharp, readable text." Of course its not
>upgradable. They are comparing the mobile iMac with a clucky collection
>interconnected boxes.

I guess all non-iMac Apple Macs are just "a clucky collection of
interconnecting boxes" as well.

>The stupidest insult: "interim CEO Steve Jobs' boast that the iMac is faster
>than the quickest Pentium II is pure hype--and it falls apart under scrutiny."
>
>WRONG. If they would bother to actually QUOTE what Apple says, and
>actually provide DETAILS about what Apple used for comparison THEIR HYPE
>would fall apart under scrutiny.

They did quote what *Steve Jobs* said: "The iMac for $1,299 toasts the
fastest PC money can buy at any price--the Pentium II 400," said Steve
Jobs, Apple's interim CEO. ..."
(http://www.apple.com/pr/library/1998/aug/13fast.html)

>What Apple PROVED:
>
>1) The iMac beats even a 450 Mhz Pentium II computer in BYTEmark Integer
>benchmarks. Period. "

How many times per week do you run BYTEmark on your Mac? What do you
accomplish when you run BYTEmark on your Mac?

>The G3 runs as much as twice as fast as the Pentium
>II." There is not one bit of hype here, just facts. The hype is the crap
>PC World is trying to con us with.

LOL!

>2) The iMac wipes the floor with a 233 Mhz Pentium II machine when playing
>a Director multimedia presentation. Watching this live on stage
>demonstration, as you can on any retail store demo iMac, is incredibly
>pathetic. The PC was so far behind, was taking so long to complete
>compared to the iMac, that they gave up on it. When the same multimedia
>presentation was played on a 400 Mhz Pentium II machine and a K6 400 Mhz
>machine the results were less devastating, but the iMac beat the 400
>Pentium II by at least a factor of 2, and beat the K2 at what was at least
>a factor of 3.

I have never seen these data published (not even on Apple's web site).
I am aware of the demonstration, but I've never seen any actual
numbers.

Here are a number of real-world application tests showing a general
advantage for PII systems over G3 sytems:

http://www.zdnet.com/pcmag/firstlooks/9808/imac_tests.html
http://www.zdnet.com/pcmag/firstlooks/9810/f981002a.html
http://www2.pcworld.com/pcwtoday/article/0,1510,7801,00.html
http://www.techweb.com/wire/story/TWB19980821S0021
http://www.cnn.com/TECH/computing/9811/09/macvp2.idg/
http://newmedia.com/newmedia/98/09/labnotes/Apple_G3_Workstation.html

Now, it's all very well to criticize any of these benchmarks/tests as
biased, but do you have any real data to contradict them?

>And guess what? The tests Apple did actually represent what iMac users
>would typically do with their computers! And the applications and

>benchmarks they chose were NOT biased toward the Mac!

LOL! You think that people with iMacs will not be using MS Office or
Photoshop, but they will be using Director? You also think that
Apple's tests are not biased in favor of Apple? Really????

>So who would you consider more honest? Apple or PC World.
>
>Answer: Apple.

Correct Answer: PC World.

>The loser in honesty?
>
>PC World.

Correct Answer: You.

****

The iMac may be a good choice for some people. However, trying to
make a case for the iMac based on performance is a waste of time IMO.

-Steve

The only thing certain about the future is that it hasn't happened yet.

these imac advocates are so intent at slamming pcworld's review that they forget 1 important factor - it doesn't matter that excel & word for mac haven't been as optimized for thier platform, a good review for the typical user is one that shows performance using typical products off the shelf. They could build a machine 10 times faster than a pc, but if the software is 20 times slower it still results in a slower machine. period.

What compromises? The 386 is a much newer CPU and doesn't even
go that much faster.

It's performance overlaps that of a CPU 6 years newer.

On the contrary, it IS a relevant comparison. The mostly made comparison
between PC's and 68K machines is irrelevant BECAUSE of the design
differences, and therefore canNOT reliably show the differences between JUST
the CPU's.

>
>> And the results of that comparison heavily depend on the importance of

>
>Forget about the MMU and the 386 is still better.
As I have said many many times before, I agree on you that the 386 is a CPU
to be higher classed than a 68000. I also said that I would have it compete
against either a 68020 or a 68030, as I classify the 386 inbetween those two
68K processors.

I simply added in the last post that the "usefulness" if you will, depends
really very much on what you actually need and how this is implemented or
tuned into a system. I never disputed the class differences between plain
68000 and plain 80386 CPU's.

>

By pricing and use. If you can put two 68K's in a system versus one 386 for

the same price, then that would give you a definite advantage either way, depending on what your system is intended to be used for or with.

Thanks for a good laugh. :-)
Real power without the price... and now the Mac is even called a "PC". What a shame for such a fine product. I wouldn't dare call my Atari a PC, it'd be quite an insult!

Well, like most contemporary Atari systems, it's European. The Mac is not.
So it's likely to be more difficult to get a hold of one in America.

The reverse is true for Macs as well. There are only a few stores throughout
Europe who ACTIVELY market iMacs AND put them on the shelves.

Since when is a Mac a PC? You're insulting your own systems now? The
"Personal Computer" was a design by IBM, cloned by many others.

And we do have powerapps for those who need them. His issue is not with
quality, but with QUANTITY. Which is probably why he chose Wintel and not
Mac.

Look Dumbs*it....It's my business to know the real facts involved when
comparing the features as well as performance between G3's and Pentiums.
It's a fact that apps like Photoshop, PageMaker, Director and so on perform
as much as twice the speed of the same Pentium clock speed. Even the PC

staff admitt that the G3's excell in performance.

It's also true that MS has enginnered Office 97 to perform better than Office 98 on the Mac.

To support high clock speeds you have to limit the complexity of your instruction set. If you tasked me with designing the fastest microprocessor with a clock limit of 8MHz then I would design it differently than if this limit was not imposed. Look at DEC and HP. They produce micropressors that are competitive with respect to speed but the HP chips can only be clocked to about 1/3 of the rate of the DEC chips. Does that mean that the HP chips are faster?

You where talking systems? That's odd since you were using the names of
micropressors in your posts and not the names of systems.

Actually, the 386 can retire most instructions over twice as fast as the 68000
and the glue logic is going to hurt you in the dual 68000 system.

Which is why RISC processors could traditionally be clocked at a higher rate
than CISC processors. At a given time, complexity of your instruction set is
an issue. But as technology advances, it will be less of an issue with newer
technologies to put components closer together, or radical new designs.

In the beginning, CISC processors were highly succesful BECAUSE of their
complex instruction set, and RISC was fast, but too expensive since to take
full advantage of their clock speeds and efficiciency, other system
components, or at least parts thereof, needed to be modified or designed to
take advantage of the RISC characteristics. With the introduction of
narrower and more advanced production methods, this became that one step for
production - a giant leap for mankind thing that made RISC affordable and
feasible to compete against CISC systems. Until sometime in the future,
boundaries are about to be reached again.

I think this will go on and on and on and on with some fusion between CISC
and RISC technology (CRISP?) avery now and then.

All this makes it still, a matter of perspective, point of view at a given
point in time.

>
>> It's performance overlaps that of a CPU 6 years newer.
>
>What CPU are we talking about?

He didn't say, but I think he tried to imply the 68000. I would more likely
look at the introduction of the 386 and the 020, or even the 030.

No I was not. I just leveled the value of a pure CPU comparison. As you may
recall, the original thread or branch of thread that went into the 386 vs
68K thing came from Clockmeister. And he meant a comparison of CPU's bearing
in mind the way they are commonly implemented. Yes it's not a completely
fair agreement, but if you do compare in that way, then I think it MIGHT be
possible to view performance differences as such.

I tried to show that it is virtually impossible to compare just the CPU's
considering the different ways these are commonly implemented. I did
however, agree on you from the purely CPU point of view (as you can read
above). I merely tried to say that I can imagine that a lowlier CPU can be
used in a competitive _way_ e.g. be implemented in a way that a _system_

(yes, system) can be built to compete against a 386. Ofcourse, I would normally just compare 020, 030 and 386 (as I've stated before).

The "comparing systems" you are talking about was in pursuit of things that others have already said and were to show that I can imagine how people can view differences that way. Furthermore, I did not mention systems by names because I meant the most common use of the CPU's in those systems, how they were addressed, used, implemented and operated, regardless of operating system or hardware architecture. This is quite different for Intels and Motorolas.

>
>> >Actually, I'm not sure how the 68000 can be considered competitive.

>
>Actually, the 386 can retire most instructions over twice as fast as the 68000
>and the glue logic is going to hurt you in the dual 68000 system.
And that is why I said "depending on what your system is inteded to be used for or with". I don't know how much a 386 costs these days, I do know a 68K has been cheap for ages. Wasn't it around from 1979 onwards??

Again, I do not dispute differences at processor level. I just try to say that the USEFULNESS of either processor given their characteristics, and even more important in some cases, their BEHAVIOUR (i.e. bus efficiency, overheadtime, implementation-dependant) heavily depends on
a) WHAT do you want to use the system for?
b) HOW is the CPU used in that system.
c) HOW MUCH does all this cost?
d) WHAT is in the CPU's microcode and HOW is it going to help you

That's all I tried to say, really. Again, why should I be discussing purely CPU's with you as we ALREADY agreed on that SEVERAL times? (just re-read this post :-)

:-)

Web site udpating:

After technical problem with our accommodation, our web site was broken.
Actually, he is running correctly with many modifications in bonus.

- a page with french and foreigners distributors.
- a page with various links wich claims to grow...
- a quick access to tested softwares on CENTurbo II (163 refenrences).
- a CT2 FAQ in the softwares page of CENTurbo II menu.
- new version of CBOOT 1.0.8, PUTFLASH 1.0.8 + FLASH.BIN 1.0.2,
CENTscreen 3.4.0, VIDEOMOD 1.2.0. All from 12/08/1998.
- new version of CENTview 2.9.0 from 11/25/1998.
- new version of CECILE Demo 1.84 form 11/10/1998.
- new version of SANDRINE Demo 3.0 from 05/11/1998 that you can use to really
scan but with colorless :-)

CENTurbo II: Available in January 1999

The CENTurbo II revision B is in productions. She will have a new hand-made
Fast-Ram controller (same on the Phenix) and more quickly.

A better integration permited to decrease the price to 1890FF TTC !

The serie will be limited, contact your resellers...

Phenix:

The prototype is routing phase according to the last implantation (see Phenix
page).

We finish the USB and PCI validation at the moment (hardware and software!).

The DSP+20-bit audio part is valid.

Thanks for your attention.

yep - despite TIFKAS swearing up and down that the iMac's graphics card was speedy despite the fact that it was old technology, Apple disagreed with him (partially due to pressure from customers) and put in a better graphics card. They still soldered it in, though....

Apple also put a real reset button on the rev. B - when the A release locked up, you had to reset it using a bent paper clip through a tiny hole in the back. NOT a good design feature :)

They've also included OS 8.5, which adds some nice new features (including Sherlock, which I was taken with, this is a neat Internet innovation).

So now it's a bit less underpowered than the original release (though far from "blowing the doors off a 450mHz Pentium II" - honestly, is Don Crabb on crack?).

Still overpriced, though - but rumours are going on in comp.sys.mac.advocacy that after MacWorld Apple will be slicing $300 US off the retail price. Make it $500 and you may have a customer here :)

BTW, Bengy Collins (the MagiC maven on the net) has bought an iMac himself, and has been experimenting with MagiCMac on it - he reports very good results, if anything it makes a nice TOS clone that's definitely peppy :)

A note to TIFKAS - guess which computer is also NOT mentioned on Future Shop's web site? (http://www.futureshop.com) Particularly the Canadian site. The iMac seems to be Future Shop's "our little secret" - doing a search on "iMac" only brings up the iMation Super Disk.....

Well, to be fair (even though he doesn't deserve it the way he treats others around here...), there is no one called TIFKAS either, even when we all know who we mean by that. Funny how people still reply on the basis of apperantly imposed nicknames...

Yea, I remembered that issue. I think I still have it in storage. Use to read Bruce Webster's articles on the 68K wars. I did consider the 1040 at one time due to price but went with the Amiga because it was more advance and available. It took Atari months to ship the 1040's to the U.S. shore after the Byte publication. Atari's excuse at the time I believe was that shipments were delayed in the Philippines due to the revolution against the Marcos regime..

November 17th 1998. And still runs in 512 kB...

Markku

"Same clock speed" is hardly an issue when comparing different
processors with different operating systems.
If it is, then please compare Calamus, Apex or Papyrus on a 16 MHz Atari
with an equivalent (or almost) program on a 16 MHz PC or Mac...

Markku

This year. Point your oh so good browser to www.milan-computer.de
Progress? Bull shit. Sales bullshit. Everyone knows that the best hardware
vendor is, ironically, Microsoft - they creat the NEED for those upgrades.
Did it make the computers do anything they couldn't do before, or better?
No...

Atarians only buy REAL upgrades. Do you know how many service packs there
are for all those Microshitty apps? Not to mention the HUGE array of
hotfixes...

You do realize that Atari an AMERICAN company? They also have production
facilities in the U.S. or, at later times, used those of IBM.

>the Byte publication. Atari's excuse at the time I believe was that
>shipments were delayed in the Philippines due to the revolution against the
>Marcos regime..
Complete and utter bullshit. For the first time in Atari history, machines
were being shipped to Europe first because:

1) at the time the Europeans were prepared to pay a higher price for their
computers
2) the Europeans showed a more lucrative and greater market with less
competition from other manufacturers at the time

This was purely a management decision. A bad one from the marketing point of
view because many American Atari customers felt "left out", "abandoned"
(much like the European Mac buyers really :-0) but a good one from a purely
financial point of view. Remember that the Tramiels bought only PART of
Atari (the home computer division) which was severely crippled by the Warner
Bros. management. It was a mess and the first objective was to make it
healthy financially. That is the only thing I have to give the Tramiels
credit for. Atari always had enough cash in resere - they're good financial
guys, but sadly the poorest marketeers I've ever come across. Well, unlike
Apple, at least they didn't lie and/or bend the truth about their machines
capabilities...

>
>So what happened?
It got ported to the Mac and Windows NT (NT _ONLY_) as well. The Mac version
died I think. It's still reasonably popular but lacks the broad support that
the traditional establishment of DTP apps have. Calamus is more popular in
Europe than elsewhere.

You really don't know shit, do you? I mean - chunks is not a form of spam.
Spam is unsollicited E-mail or postings that are normally not relevant to
recipient and unasked for. Apple press releases are normally relevant to the
comp.sys.atari.advocacy newsgroup. I can understand if you crosspost it to
say comp.sys.atari.st or something, because you want to convince these users

to convert to iMacs or something but certainly the .advocacy part in the newsgroup name gives a very clear signal that these postings ARE irrelevant and therefore UNWANTED SPAM which constitutes poor nettiquette.

>
>
>Your Atari is a PC...duh! Or is it your personal MB..

^^^^^^^^ that too!

NO - The PC, or, PERSONAL COMPUTER, is a patented and copyrighted hardware architecture devised by IBM around an Intel microprocessor, the Intel 8086. What we refer to today as the "Wintel" platform is what's called "PC" or PERSONAL COMPUTER or PRETTY CONTEMPTIBLE.

There are, besides the PC, a couple of varieties:

The PCjr (IBM's "1040" with 320x200 in 16 colors and three monophonic beeps in stead of one) - after it failed miserably in the market, Tandy based it's PC compatibles for a long time on this and added such things as a DAC.

The PC/XT (eXtended Technology) - based around a i8088, with eight 8-bit ISA slots, 20MB hard disk drive, and a floppy drive. Support for cassette only in BIOS (PC had a connector for it).

The PC/AT (Advanced Technology). The 286 machines and upwards.

Why do you think the phrase "PC-compatible" was invented?

If it's your business to know these things, then study a bit harder! :-)

The term is 'microcomputer' for those who came in
after Microsoft came to dominate the industry and
even get drooling MacVocates like Petey-boy to call
their machines PC's.

I know where Chris was - but - last time I tried his 'phone was OS and
I have been told he isn't doing Atari stuff any more having moved over
to Mac out of his home.

I have no problem with Edmonton, by the way, just so long as they keep
losing to Calgary (we won't count the Flames - everyone whups them !)

Evil grin inserted here

The Canadian Curmudgeon (in sunny, windy, +3C, Calgary)

well, speaking as a Hamilton boy, I'd have to say that I don't feel all
that kindly towards Calgary right now! <grin> Oskiweewee oskiwahwah!
Speaking of Chris and Mac, it would make more sense for him to
concentrate on the bigger market Macs represent here rather than the
Atari market here. He's got a battle to get DA's Layout known to Mac
users, never mind accepted.

Well, in his defense, I'd say I have to agree with his assessment of Don Crabb. He kind of reminds me of Guy Kawasaki--in many ways a True MacBigot&#65533;, and thus a rather embarassing lieutenant in the ranks of advocacy. When it gets down to it, the main reason he is pro-Mac is because he has always been pro-Mac, he built his career on Macs, and there's no way in hell he's giving up his position of "prestige", no matter how laughably ignorant he may come across sometimes.

He got a little press by getting into a snit on the MacCentral web site about how "MacOS X Server is cancelled!!" about a month ago. The FUD didn't stop until _Steve Jobs himself_ told him that he was _wrong_.

My suspicion, confirmed partly by a message on Apple's MacOS X Server web page, is that Adobe is giving them a hard time with terms for Display PostScript... because of the threat this could represent to its lucrative laser printer-side licensing.

But Don Crabb didn't put his ear to the ground for tidbits. He just got up one day and decided "it's dead!", proving he's reeeeal bright.

It felt dead, It was supposed to ship this fall/ winter and we haven't
seen anything after DR2. The suits at apple took a week to get back to him
(they probaly had to look up rhapsody in the corperate dictionary) It was
and is a valid question to ask Apple. "Is this another broken promise?"

thank you for confirming what I suspected about Don Crabb.

let's face it - when even non-journalists in comp.sys.mac.advocacy
can make a better case for the Mac without using over-hyped hyperbole
like the unfortunate Mr. Crabb, I think it speaks volumes about his
integrity, his competence, and ultimately his credibility. It also
confirms that TIFKAS, unable to face the truth about Jobs' overblown
claims about the iMac's "ability" to "toast Pentium processors" (which
has now been proven false by several tests that DO show how the tests
were performed, and give the results of those tests), will clutch at any
knee-jerk, gung-ho, rose-coloured-glasses posts from any source, no
matter how outrageously bogus, in order to bolster his own sagging
credibility and vendetta against all things Atari.

However, I'd say lumping him in with Guy Kawasaki is unfair. Mr.
Kawasaki is fairly bright, is a true legend in the Mac world, and at
least he is intentionally funny :)

let's see you try to wiggle out of this one, TIFKAS.....

True, and I absolutely agree with you about that. However, for someone in
Crabb's position to start crowing about the death of MacOS X Server,
without having one scrap of _solid_ evidence other than mounting fear and
a strange story from Germany... well, that's seriously irresponsible.
It's one thing for us here in the newsgroups to FUD endlessly, but Crabb,
now he could do _real_ damage.

I just don't have much empathy for someone who does something like that.
Hell, all he does is bitch and moan anyway...

I guess 'Chunks' will claim this as a Steve Jobs reality distortion field.

Current PowerMac G3's Sold Out! The Apple Store has the following message:

"Surprised by our success!

Due to extremely strong Q1 sales, Apple has sold
all Power Mac G3 systems available*, including servers and
displays, through the quarter end.

While this is evidence of the strong support for
the Mac platform from Apple's professional customers, it has placed
the units in short supply. Not to worry, in early
January there will be plenty of Power Mac G3 systems, from entry
to high-end configurations, including servers and
displays, to meet your demands.

*The 266MHz Power Macintosh G3 Desktop "Entry
Model" is still available."

and rightly too - as comp.sys.atari.st is a chartered newsgroup
which disallows the posting of such MCIBTYC drivel - any complaints
against you were justified. But we all know what a boor you are when it
comes to nettiquette.

as for being a "crybaby" - well, TIFKAS, you seem to be the one who
gets his diapers in a wad when you're so soundly refuted with the true
facts....but I sympathize, it must be vexing discovering that mummy has
put overripe bananas in the Pablum.....

Still harbouring your paranoid fantasies about imaginary "Atari
Jihads" that are "out to get you", I see.

>
>This is the appropriate area in the usenet advocacy.

no argument there. Now if you'd only stop the FUD and start
reporting the facts....

Nobody named "Chunks" here, mannnn....

<mindless press release from Apple snipped>

As for MY opinion - well, I'm happy for Apple's success. Now, how
many of these were actually sold? Come to think of it, how many were
actually MADE?

if they added the claim that "and by the way, these computers smoke
Pentium II 450 mHZ PCs - we don't have empirical evidence, just trust
Don Crabb and our cringing toady Peter Sinclair!", then that would
qualify as a distortion field.

BTW - that's spelled "Steve Jobs Reality-Distortion Field" -
accept no substitutes! :)

What's shipping today doesn't deliver any relative benefit
until it's time to do some serious number crunching. What
should be user-bound activities still remain user-bound.

Most of what the 'target grannies' for the iMac are supposed
to be interested in in no way benefits from being able to
'smoke a PII/450' EVEN IF true...

I believe that you've transposed the CPUs.

The 1981 IBM PC used an 8088 (8 bit data bus, 8 bit ALU [which would make
a second pass over the data when asked to do a 16 bit computation], 16 bit
registers, segmented memory addressing [65536 segments of 16 bytes each]).

The 1983/4 XT used an 8086 (which, IIRC, increased the data bus and ALU to
16 bits)

You've got it all wrong. That 512k ROM does EVERYTHING that those other
O.S.'s do. Only with less memory, leaving MORE for applications.

Besides, I get the distinct impressio that you are not quite familiar with
the Atari world. If you rely on press releases such as those released or
crossposted by yourself to this and other newsgroups, then I know why. You
do not know a thing about upgrade and/or update options for Atarians. Let
alone PC's. And no, I'm not gonna fill you in, boasting what stuff we got,
because you are simply not worth it if you're not going to come to senses or
reason anyway. Wouldn't it be easier to take off that salesuniform for a
while and be honest to have an intelligent, cogent and openminded discussion
about something worthwile, something useful for everyone involved?

I mean, I have nothing against Macs. On the contrary, I'd like to hear more
about them. Especially where emulation of both platforms is concerned. And
one or two occasional posts - which don't belong here tbh - I don't mind. It
attracts some interest - but hey, your press release crosspostings do that
too right? Yes they do, but only the flamy and childish "mine is better than
yours" and vice versa thing. Are you sure your daddy allows you to sell
items that expensive?

Well forget about it. I hope you get my point.

Let's see... Windoze 98 just arrived. Look up the Windoze 98 website. Hey? Hurrah... the year 2000 hotfix is there. And oh yes - an extra service pack that fixes the problems created by 98 to make FAT32 W95 OSR 2.1 sometimes unaccessible under 98 and other things... come on... I am a network administrator as well as an IT consulting sr. manager and unlike you, it's not my business to sell but to _know_, and, as such, to make the choices made on management level. I'm realistic. I'm an Atari fan yes, but do I advise any of our clients to blindly go out and buy Ataris? Ofcourse not - there is an established market to consider wether I like it or not: that includes thinking different and also considering other options like where and how a system will be used. When it comes to networking, a cheap Ethernet with PC's and NT is usually the way to go. Not in terms of quality, but in terms of quantity and securing a feasible path for the future - because Macs are not going to take over the world within two years, however sad or great that may be. You wanna sell something?

It is MY BUSINESS to know technical and factual stuff, and to read through the advertising mumbo jumbo.

I am emailing all Atari related sites/newgroups to check out my new page I am working on at http://papabyrd.atari.org

It's an Atari Commercial Archive! If you have suggestions or if you have a commercial that I don't have, please let me know so I can get it from you and post it online with a a review. I always wanted a complete site to go to get this stuff and I always found it scattered around a bit, so I figured it was time to do something about it! This site is not totally complete however all commercials are online and it works OK. I need to optimize it for Netscape, so try to use Internet Explorer if you can, although Netscape works fine too, it just looks funny (need to work on that).

That's my disclaimer, other than that, send me your comments!

Thanks,
scott@papabyrd.com

>First check out the Mhz comparisons. Look stacked much? Right off the bat
>they look scared. Why not compare 233 Mhz PC machines with a 233 Mhz G3
>Mac, eh? I know why: The iMac would blatantly beat its butt.

I don't know why we have to keep explaining this one. There are at least 2 reasons to make such comparisons. First, the Celeron system costs less than the iMac. Most people compare systems on price, so that is a reasonable comparison IMO. Second, Steve Jobs himself invites the comparison between the iMac and the 400 Mhz PII. I quote: "The iMac for $1,299 toasts the fastest PC money can buy at any price--the Pentium II 400," said Steve Jobs, Apple's interim CEO. ..." (http://www.apple.com/pr/library/1998/aug/13fast.html)

>And then lets
>consider their price comparison argument: do their PC machines at such low
>prices include 100 Base-T Ethernet? Nope. Infrared networking? Nope, in
>fact no networking at all.

>6 MB of VRAM? Nope, only 2.

When they tested the iMac it only had 2 MB of VRAM and had the Rage IIc board compared to the Rage Pro in the Packard Bell. So, you say, the iMac is better configured now. True, but so are PCs.

>512 K backside level 2 cache? Nope, only 128K non-backside cache.

LOL! The 128 KB of *on-chip* L2 cache is much faster than back-side cache. Depending on the application, larger may be better than faster, and vice versa.

>USB? Apparenly Nope.

Do some better research. Of course it has USB.

>56K modem? Apparently Nope.

Yes

>Dual headphone jacks? Nope.

If that's important, spend $5 (if that much) on a splitter cable.

>CD-ROM drive of any speed? They don't say.

They don't say because it's obvious that it does. How can you install most software without a CD? For the record, it has a 32X CD-ROM which is faster then the iMac's 24X.

>All-in-one portable? No way!

True

>Runs both Mac and PC software? No Way!

Mostly true (there are some 68K emulators), and also mostly irrelevant.

>Next are the applications they chose, hilarious:

>1) Megalosoft Excel and Word 97 on the PC and Excel and Word 98 on the
>Mac. Yeah right, like Megalosoft ever cared how fast their software ran on
>a Mac. Any child familiar with Macs and PCs will tell you Megalosoft's
>software has been running slower on the Mac for AGES! Some test. Totally
>worthless.

I guess that's why it is one of the best-selling software packages for the Mac.

>2) Photoshop 5 on a 5 MB and 20 MB image. They don't bother to provide any
>details here, they just say "we applied filters and effects, followed by
>image resizing and color conversion operations." Really. Why? NO ONE
>should be running Photoshop on ANY of these computers! They all have 15
>inch monitors, which no one running Photoshop would use, except of course
>dimwit PC users who don't know better. I would NEVER advise anyone to use
>an iMac for Photoshop. AND add to that what I have to assume is the dirty
>trick they hid from us: That the "filters and effects" were written to be

So what do you suggest?

>So here we have a stacked set of test, and wowie wow, the iMac lost. Big
>surprise.

What would you suggest as a fair test?

>And to really show off their evil look at what they say:
>
>1) "the world can't make up for slow application performance, poor
>sound quality, and no upgrade path."

How does that make them evil? Is everybody that thinks the iMac is
overpriced and underpowered evil?

>The slow applications are only the apps THEY CHOSE as faster on the PC in
>the first place.

So, contrary to many other Mac advocates, you are claiming that
Photoshop runs faster on the PC than on the Mac?

>The "poor sound quality" is better than any consumer level add-on speakers
>you can buy. Nice try.

It's true. Have you actually listened to the sound on PCs priced at
or below the iMac price?

>The "no upgrade path" they refer to is the monitor. Duh. The iMac is a
>portable all-in-one computer, with what PC World admit is a SUPERIOR video
>quality "yielding even focus and sharp, readable text." Of course its not
>upgradable. They are comparing the mobile iMac with a clucky collection
>interconnected boxes.

I guess all non-iMac Apple Macs are just "a clucky collection of
interconnecting boxes" as well.

>The stupidest insult: "interim CEO Steve Jobs' boast that the iMac is faster
>than the quickest Pentium II is pure hype--and it falls apart under scrutiny."
>
>WRONG. If they would bother to actually QUOTE what Apple says, and
>actually provide DETAILS about what Apple used for comparison THEIR HYPE
>would fall apart under scrutiny.

They did quote what *Steve Jobs* said: "The iMac for $1,299 toasts the
fastest PC money can buy at any price--the Pentium II 400," said Steve
Jobs, Apple's interim CEO. ..."
(http://www.apple.com/pr/library/1998/aug/13fast.html)

>What Apple PROVED:
>
>1) The iMac beats even a 450 Mhz Pentium II computer in BYTEmark Integer
>benchmarks. Period. "

How many times per week do you run BYTEmark on your Mac? What do you
accomplish when you run BYTEmark on your Mac?

>The G3 runs as much as twice as fast as the Pentium
>II." There is not one bit of hype here, just facts. The hype is the crap
>PC World is trying to con us with.

LOL!

>2) The iMac wipes the floor with a 233 Mhz Pentium II machine when playing
>a Director multimedia presentation. Watching this live on stage
>demonstration, as you can on any retail store demo iMac, is incredibly
>pathetic. The PC was so far behind, was taking so long to complete
>compared to the iMac, that they gave up on it. When the same multimedia
>presentation was played on a 400 Mhz Pentium II machine and a K6 400 Mhz
>machine the results were less devastating, but the iMac beat the 400
>Pentium II by at least a factor of 2, and beat the K2 at what was at least
>a factor of 3.

I have never seen these data published (not even on Apple's web site).
I am aware of the demonstration, but I've never seen any actual
numbers.

Here are a number of real-world application tests showing a general
advantage for PII systems over G3 sytems:

http://www.zdnet.com/pcmag/firstlooks/9808/imac_tests.html
http://www.zdnet.com/pcmag/firstlooks/9810/f981002a.html
http://www2.pcworld.com/pcwtoday/article/0,1510,7801,00.html
http://www.techweb.com/wire/story/TWB19980821S0021
http://www.cnn.com/TECH/computing/9811/09/macvp2.idg/
http://newmedia.com/newmedia/98/09/labnotes/Apple_G3_Workstation.html

Now, it's all very well to criticize any of these benchmarks/tests as
biased, but do you have any real data to contradict them?

>And guess what? The tests Apple did actually represent what iMac users
>would typically do with their computers! And the applications and
>benchmarks they chose were NOT biased toward the Mac!

LOL! You think that people with iMacs will not be using MS Office or
Photoshop, but they will be using Director? You also think that
Apple's tests are not biased in favor of Apple? Really????

>So who would you consider more honest? Apple or PC World.
>
>Answer: Apple.

Correct Answer: PC World.

>The loser in honesty?
>
>PC World.

Correct Answer: You.

****

The iMac may be a good choice for some people. However, trying to
make a case for the iMac based on performance is a waste of time IMO.

-Steve

The only thing certain about the future is that it hasn't happened yet.

here's an interesting missive from comp.sys.mac.advocacy -
complete with figures and web links - that puts paid to all of TIFKAS'
(The Idiot Forever Known As Sinclap) claims that the iMac is faster
than a 400-450mHZ Pentium II. In fact, you'll note that a CELERON
wipes the floor with an iMac in many circumstances....

TIFKAS has yet to post any hard evidence how Don Crabb came across his
final conclusion about the overpriced, underpowered iMac being able to
toast Pentium IIs - and I'm sure we never will, either. We WILL,
however, see more of his mindless posting of Apple and InCompUSA press
releases, and his insistence that PC magazines' results are of no
consequence because of their "vested interests" (personally, I think
it's more a three-piece suit).....

>The $500 PCs are a joke--not even within spitting distance of the iMac.
>
>2. As I've pointed out, the Celeron system only beats the iMac when you
>cheat--by putting twice as much RAM in the Celeron (PC World, December
>1998). When you equalize the RAM, the iMac finished in 6 minutes vs. 7
>minutes for a _333_ MHz Celeron. AND, that's even using tests dreamed up
>by PC World. Are you going to pretend that these were fair tests? Even
>after seeing that 2/3 of the tests were MS crippleware?

I see that Joe is still trying to make a pig fly ;-)

In the December, 1998 PC World test (p. 74-76) the iMac was faster
than the Celeron on only 1 out of 5 tests. Joe mistakenly believes
that it is valid to sum the results from this test. However, if you
apply that principal to other tests (as mistaken as that might be) all
of a sudden, it's no longer valid to do so. Joe is so biased and
partisan that he seems to have lost touch with reality.

For those of you that are interested in the *real* results from a
number of tests with iMacs/233 Mhz G3s and PCs, I present the
following:

November 1998 Maximum PC (page 100):
IBM Aptiva E3N vs. iMac):
300 Mhz K6-2 vs. 233 Mhz G3
Quake: K6-2 42% faster
Premiere: K6-2 81% faster
Photoshop image resize: K6-2 13% faster
Photoshop CMYK conversion: iMac 24% faster
Photoshop Gaussian Blur: K6-2 15% faster
Inspire 3D render: iMac 53% faster

December 1998 PC World (pp. 74-76)
iMac vs. 333 Mhz Celeron
(results are listed in bar graphics that are hard to interpret)
Word: iMac approx. equal to Celeron
Excel: Celeron approx. 100% faster
Photoshop (5 MB): Celeron approx. 25% faster
Photoshop (20 MB): iMac approx. 50% faster
Quake: Celeron 6% faster

(http://www.zdnet.com/pcmag/features/homepcs98/bench.html)
iMac vs. 333 Mhz Celeron
Ray Dream Animation: Celeron 456% faster
Ray Dream Still Median: Celeron 71% faster

Photoshop Gaussian Blur: Celeron 67% faster
Photoshop Noise Median: Celeron 55% faster
Photoshop lighting effects: Celeron 63% faster
Filemaker Pro import: Mac Celeron 8% faster
Filemaker Pro Sort: iMac 12% faster
Filemaker Pro Export: iMac 4% faster
Quake Time Demo 2: Celeron 41% faster
Quake Time Demo 3: Celeron 41% faster
Quake Time-Refresh: Celeron 62% faster

http://www.techweb.com/wire/story/TWB19980821S0021
233 Mhz G3 vs. 300 Mhz K6-2
MS Word: K6-2 approx. 160% faster
MS Excel: K6-2 approx. 340% faster
Photoshop: K6-2 approx. 20% faster
Filemaker Pro: K6-2 approx. 150% faster

http://www.zdnet.com/pcmag/firstlooks/9808/imac_tests.html
iMac vs 333 Mhz Celeron
Adobe Acrobat
Search: Celeron 57% faster
Scroll: Celeron 110% faster
Claris Works
Spell Check: iMac 150% faster
Search-and-Replace: iMac 8% faster
FileMaker Pro
Import: Celeron 8% faster
Sort: iMac 12% faster
Export: iMac 4% faster
Excel
Integer Calculations: Celeron 252% faster
Screen Updates: Celeron 464% faster
Word
Spell Check: Celeron 153% faster
Search-and-Replace: Celeron 250% faster
Photoshop
Gaussian Blur: Celeron 67% faster

Wireframe animation: Celeron 456% faster
Still Frame: Celeron 71% faster

http://www.zdnet.com/pcmag/firstlooks/9810/f981002r1.html
233 Mhz iMac vs 333 Mhz Celeron
Photoshop
Unsharpen Mask: Celeron 61% faster

RGB to CMYK: Celeron 18% faster
Pixelate Mosaic: Celeron 44% faster
Stylize Trace Contour: Celeron 81% faster

http://exodus.physics.ucla.edu/appleseed/appleseed_report.html
233 Mhz iMac vs. 300 Mhz PII
2D particle simulation
Push Time: iMac 18% faster
Loop Time: iMac 16% faster

****

As you can see, there is a large body of evidence that refutes Joe's lame assertion of *general* iMac speed superiority, let alone anything close to integer BYTEmark numbers. In fact, I haven't even presented the data comparing the iMac with 400 Mhz PII, where according to Mr. Jobs, the iMac is faster than the 400 Mhz PII (http://www.apple.com/pr/library/1998/aug/13fast.html)

-Steve

****
They said it couldn't be done,
but I grinned and went right to it.
I tackled the job that couldn't be done,
and by golly, I couldn't do it!
****

Source record: 3873

My 8 mhz ST will load and spell check a letter to my mother faster
than an i MAC and the fastest PII out there. It will check my e-mail
and send a letter faster than a 450mhz pII will load IE. My 8mhz ST
boots up in 5 seconds. I can boot my ST, connect to the internet,
write a letter, email it, and have a cup of coffee before the fastest
PII evens finishes the memory check. That's "real world" So in
conclusion, I will use my ST do my business and then beat you all to
that hot date with Cindy Crawford :')

My Lynx and 2600 will load up a game faster than any computer out there..

But can your OS acomplish what the others have?

Windows will do that automatically for you. Other systems call it a "crash"

Not sure how stable a iMAC is. I would guess it's a lot more stable than Windows.

Real world is what people use a computer for. Your average user doesn't rotate and rescale 20 MB images. Nor does he/she render 3D worlds to run around in. Your average user types letters/e-mail, cruises the net, balances a checkbook, keeps a scheduler, and plays games.

Technology in computers has reached a point where it far exceeds the needs of the average user. That's why sub $500 PC's are around the corner, and if you follow history on any consumer product, they will hit the magic $250 and less number.

Computers are also the only manmade phenomenon that do not concentrate on efficient use of resources. The power used to run a 400MHZ processor may be minimal, but multiply that by hundreds of millions and there is a lot of energy wasted. Highly optimized software can make a slower processor run faster than a faster processor with inefficient software.

>>upgrade.. Nice try..

there are - it's called MagiC. It's called N.AES/MiNT. It's called Linux. All three are wonderful, all three have true pre-emptive multitasking. Plus TOS itself is well-known for running rock-solid MIDI regarding timing. Try that with your iMac (oh, sorry, you can't - that's why Future Music magazine recently recommended their readers NOT to buy an iMac for making music, due to its lack of MIDI interface or any third-party support in the MIDI interface market, not to mention its USB being too slow for hard disk recording. Oh, and Steinberg hinted that if future Macs are going to be set up like the iMac, it may drop all Apple support altogether.....)

BTW, you COULD try running OS 8.5 in 10mB, but you won't get very much done (and it'll be slow to boot). And besides, why then does the iMac come with a minimum 32mB? BTW, according to a recent review of 8,5 in The Computer Paper (fine nationwide free computer tabloid in Canada) the reviewer mentions to get any real use out of it, you'd really have to have 64 meg installed. (He generally liked it, though).

If this is "progress", hand me my stone knives and bearskins (in the form of my Falcon and Powerbook 140)....

Cruising the net can require fairly good hardware if you are want the experience to be fast or you look at a lot of hardware intensive content (movies, java, VRML, etc.) Playing games can also be a hardware intensive task. My favorite game is Activision's remake of BattleZone. It requires a fast processor and 3D acceleration to look good.

It's hard to view computers as any other consumer item when they are so hard to use. A lot of consumers can't set the clocks on the VCRs or need to be shown how to put multiple disks in a CD changer (I had to explain how to do that yesterday). I think ease of use is more of a barrier than price.

That's also true of others things e.g. light bulbs. What type of light bulbs do you have in your house? If you are using incandescent bulbs then you are using power unnecessarily and filling landfills. I could always leave my computer on and waste less energy than you are probably wasting on light. Same with transportation, heating, cooking, etc.

Wait a second, there are reasons for using DejaNews as a newsreader aside from being unable to configure a "real newsreader":

- dejanews has excellent searching options
- dejanews doesn't force you to use the same computer all the time because you'd lose all your state information when you switched newsreaders
- dejanews is very fast at getting headers (because it can get them only as it needs them)

Without any real PMT or protected memory, it's likely
a competition based on who can f*ck up the quickest
likely ending in a draw.

>
>Real world is what people use a computer for. Your average user
>doesn't rotate and rescale 20 MB images. Nor does he/she render 3D

However, the average user is likely to use more than 4M
of RAM to futz with images these days. Technology has
advanced quite a bit since 1985 & the images are no longer
limited to a 32K framebuffer.

>worlds to run around in. Your average user types letters/e-mail,
>cruises the net, balances a checkbook, keeps a scheduler, and plays
>games.

...Doom is 5 years old already. Rendering 3D worlds in
high resolution and high colordepth is actually quite
commonplace these days.

>Technology in computers has reached a point where it far exceeds the
>needs of the average user. That's why sub $500 PC's are around the
>corner, and if you follow history on any consumer product, they will
>hit the magic $250 and less number.

While applications have hit a brick wall and are completely
un-innovative for the most part, games are not. Also, more
and more people are finally using the image manipulation and
video capacities of their now overpowered machines.

Consumers in 1999 are slowly moving towards the Amiga 2000
level of functionality. Although, overpriced iMacs are still
being targeted towards the more pedestrian 'Atari ST' level
users.

3126. iMac tops November retail sweeps!

Newsgroup: comp.sys.atari.advocacy
Date: 1998-12-22 00:00:00 UTC
From: sinclair2246@my-dejanews.com
Message-ID: <75ot88$r76$1@nnrp1.dejanews.com>
Source record: 3887

Yes 'Chunks' the iMac is selling well despite your asertion...

How has the Milan sold? How come its not available in the Twin Cities?

Apple's iMac Top Retail Seller In November
(12/22/98, 10:13 a.m. ET)
By Reuters

SAN FRANCISCO -- Apple's novel iMac computer was the
top-selling PC in November at both U.S. computer retail
stores and
through mail order, according to PC Data, a market
research company.

The iMac accounted for 7.1 percent of all unit sales and 8.2percent of
total retail revenue in the United States in November.

Retail and mail order, however, presents about 15 percent to 20 percent of
the total computer market worldwide, PC Data said.

PC Data, based in Reston, Va., said the iMac's rankings have steadily
improved, moving up from fourth place in August to third in September and
second in October.

This resulted in a doubling of Apple's overall market
share, from 5
percent or below prior to August, to approximately 10
percent of the
U.S. retail market, since the launch of the iMac in
August.

In November, the iMac led, but was closely followed by sales of Compaq's
Presario 5150 with an Advanced Micro Devices K6- 2 processor and the
Hewlett-Packard Pavilion 6355 with an Intel Celeron processor, which was the
No. 1 PC less than $1,000 in November.

The average selling price of the iMac in November was $1,226, down
slightly from its retail price of $1,299, which accounts for some price
cutting or other product bundling by retailers. Some retailers are throwing
in a printer or other peripherals with the purchase of an iMac.

Last week, Best Buy Computer, a computer retailer, said
it had cut the
price of the iMac to $1,099.

Stephen Baker, PC Data's senior hardware analyst, said he did not believe
the iMac would continue to lead through the month of December, because of

price competition from other PCs.

You also left out Be OS, Java and true linux...

There will be midi for the imac...With the large installed base there will be
midi in the comming months.

If Steinberg doesn't do it...their competitors will.

MIDI over a polled 12M(BITS)/s bus. I can just see the
Steinbergs just salivating at that prospect.

>
>If Steinberg doesn't do it...their competitors will.

It's more likely that their competitors will
discover a kernel that they can tweak to their
liking (like ST or Falcon MIDI hardware) &
can run on Falcons, Amigas, Alphas, Macs or
even cutrate PC's.

BEOS? You have to be kidding - Apple isn't even giving Be any licensing or programming info.

Java - dead out the gate, overhyped.....

PPC Linux? oh, yes, available RSN - we've had Linux available for the last three years. Playing catchup again.....

>
>There will be midi for the imac...With the large installed base there will be
>midi in the comming months.

why not now? Musicians want this hot technology NOW, not RSN .and with Apple's well-known non-support of the MIDI community regarding standards...

And USB is STILL too slow to do hard-disk recording.

>
>If Steinberg doesn't do it...their competitors will.

If Steinberg doesn't do it... their competitors may well ask why, and emulate them, if Apple doesn't get their collective butts in gear....

>more than TOS period

TOS can do everything thrown at it, as attested to many satisfied
Atari users, as well as Hades and Milan users - and without the crutch
of a bloated operating system like OS 8.5. With your well-known
non-authoritative "opinions" on TOS, which you've used a grand total of
ONCE, we know that your arguments fall flatter than a souffle....

..Can TOS use fast G3 processors?

If programmed properly, yes. The new "Tempest" upgrade board for
the Falcon was originally going to use a G3, but now they've
leapfrogged over that to Motorola's new "Coldfire" chip.....

yes, an old saying - which really should have been buried and put
out of its misery years ago. You know it not to be true, of course, but
choose to stick your fingers in your ears - an amazing feat,
considering you also do so with your foot in your mouth AND your head
"up there....."

There is nothing to stop TOS from using G3 processors. Rumor has it that
the new Tempest accelerator for the Falcon might be using PowerPC chips.

Happy? (I doubt it)

->> If this is "progress", hand me my stone knives and bearskins (in
->> the form of my Falcon and Powerbook 140)....

Kinda like the sealed up design of the iMac, eh? ;-))))

->Like my old saying..."Who needs modern hardware, OS and apps?....thats why I
->love the ST!!"...

Got a modern OS...Mint/N.aes/Thing. Does pre-emptive multitasking, for
example. How long did it take your precious Mac's to get that? (or does
it even have it yet?) Hmm...?

Got oodles of modern apps, too...and they don't require rocket scientists
to learn, gobble boo-koo amounts of Ram, or have to have bloated OS's to
run... ;-)

Well, there was no iMac in my stocking this year.
Thank the powers that made me.

But, it wasn't for lack of being good.
Santa left (along with the new house, carpet, fridge, washer) two
brand new 1999 Honda CRX 125 and 250 motocross machines. One for my
loyal Falcon using son, and one for the diehard dad.

So, Sinplop, the bike shop got the nod over any new computer that
Apple could manage to come up with. I guess for $10.5K, I could have
purchased a few iMacs. But then again, I already have a nice fish
bowl.

Merry Christmas and Happy New Year to all,

Mike

>Merry Christmas and Happy New Year to all,

There were no computers in mine this year, either. BUT, Santa gave me something I really needed - a new crock pot (one of my other hobbies is cooking, and you can make a great mushroom spaghetti sauce with these). And some things I also needed around the house, like socks, laundry detergent, toiletry items.

Now my mother got the really nice present - a Mac IIci . From ME. And now my brother and I are going to configure it nicely so she can use it for her business (BTW, I hit the jackpot with this one - according to Apple's web site, this puppy can be upgraded so it makes a nice cheap Internet box). No prejudice against these fine Apple computers, just against those few MacDavidians sorely in need of lives.

Let's hope that TIFKAS (The Idiot Forever Known As Sinclap) got what was coming to him this year - a clue, an attitude adjustment, and maybe some penicillin :)

Happy New Year to you all (including you, TIFKAS). Let's make 1999 the best year yet....

Perhaps you should send Santa My way. Amazing how many ST users are into motorcycles. My friend is the Canadian Superbike champion and just signed on with Honda Canada. They gave him two CR250s to train on as well as 3 CBR 900s. They didn't give him any iMacs either? Hmm.

Gee, can I get a fish bowl too? I broke my collarbone racing last year 1997 and it won't heal properly. I am getting my race license again this year, but I figure if this doesn't improve, I will be looking at fish for some time to come.

Anyways, I am back on the computer again. I got the falcon in June but haven't had a chance to use any of my computers.

if my mother was a computer novice, getting an ST would've made
sense, BUT she's been using Macs for a number of years, mostly borrowed
Macs from my brother. For her business she makes use of ClarisWorks. I
just felt that it was time she actually owned a Mac outright. Now it's
just a matter of getting together a monitor for it (Mike has a line on
a few of them), then a weekend configuring everything nicely for her.
BTW, I got the IIci for $75, and managed to get a used mouse for $35 (a
really nice Kensington, which normally retails around $55-62).

Anyways, I have been to busy to come out

Umm, I wish I would have gotten a now slow cooker. I warmed up a roast
for New Years, but the slow cooker is a bit used. I ended up just
setting
the pot on the stove for about 5 hours. My son got a wok. He has been
getting into cooking the last year. Just like a teenager though. In just
a few years he will be gone and I will have to do it all myself again:).
I don't think the girlfriend will ever move in:). His cooking is
better:).

My mom finally returned her Mega STE to me. I could never get them
interested
in the internet (except when they visit here), and my dad always thought
he was going to break something. That is a really hard mindset to break
when
a person feels that way. He did like Vegas Poker however:). I told them
I
would try out my Quadra 900 on them. They wï¿½n't know it's slow and has
all
the bells and whisles:).

my take on cooking came about after years of not properly watching
my diet, it was discovered that I have food allergies that were causing
some problems with my health (I have major allergies to MSG and to fish
oil). It wasn't a matter of pining for stuff I couldn't have, but
making the best of what I could :) I'm lucky in that I live in a small
area of Toronto where there are numerous vegetable stands where I can
get fruits and vegetables dirt cheap. And, of course, finding recipes
to try out. I try to limit myself to smaller portions of meat too. As
well as crock-potting, I also wok, and I just invested in a nice
Samsung microwave.

my mother wound up loving the Internet the minute she first got her
hands on it - at my brother's house on his Macs. In fact, it came in
handy when we began setting up hers, we needed to set some jumpers on a
VGA "dongle" box, but didn't have the manual for it - after doing a web
search, we found the entire manual online!

well, MacWorld is supposed to be on this week in San Francisco, so
I would imagine he'll be back loudly braying about marketshare this,
new product that. And, of course, mindless press releases.

I look forward to the debunkings :)

Of course the jihads will be in denial and still claim that the hades and milan hardware is still superior even with the new speed bump iMacs with the lower price and five new colors. The best selling original iMac is still a bargain with a price cut to $1049.

Apple Announces New iMacs - in Five New Colors; The Most Popular Computer in America Gets Even Better for 1999

SAN FRANCISCO, MacWorld Expo, Jan. 5 /PRNewswire/ -- Apple Computer, Inc. (Nasdaq: AAPL - news) today announced a new line-up of iMacs® for 1999 featuring five stunning new colors -- Strawberry, Lime, Blueberry, Tangerine and Grape. The new iMacs also feature a faster 266 MHz PowerPC G3 processor, a 6GB hard drive and a new lower price of U.S. $1,199.

iMac has become the best-selling computer in America by addressing real consumer needs not met by traditional PCs, with its simple ten-minute set-up and Internet access, and its space and cable-saving design. With their striking new colors -- Strawberry, Lime, Blueberry, Tangerine and Grape -- the new iMacs will again change the rules of consumer computing by letting consumers select something they can choose in almost every other consumer product -- their favorite color.

``'What's your favorite color?' is going to become one of the most important questions for consumer PC buyers,'' said Steve Jobs, Apple's interim CEO. ``For most consumers, color is much more important than the megahertz, gigabytes and other gibberish associated with buying a typical PC.''

In its five new colors, iMac is the complete Internet-age computer right out of the box and features:

-- A speedy PowerPC G3 microprocessor running at 266MHz with a high speed 512k backside L2 memory cache;
-- Built-in 15-inch high quality display with 1024 x 768 resolution, 13.8-inch diagonal viewable image size;
-- The world's easiest to use operating system, Mac® OS 8.5, which runs thousands of Macintosh® software titles;
-- 32MB SDRAM (now expandable to 256MB);
-- RAGE Pro Turbo Graphic controller and 6MB SGRAM;
-- 6GB IDE hard disk drive;
-- 24x CD-ROM drive;
-- 10/100BASE-T Ethernet;
-- 56Kbps modem (supports V.90 and K56flex);

-- Two 12Mbps Universal Serial Bus (USB) ports;
-- Built-in stereo speakers with SRS sound;
-- Apple USB Keyboard and Apple USB Mouse.

Pricing and Availability

The new iMacs will be available via The Apple Store (www.apple.com) and through Apple Authorized Resellers within the next two weeks for an estimated retail price of U.S. $1,199. The original bondi-blue iMac remains on sale for a limited time for an estimated retail price of U.S. $1,049.

Apple Computer, Inc. ignited the personal computer revolution in the 1970s with the Apple II, and reinvented the personal computer in the 1980s with the Macintosh. Apple is now recommitted to its original mission -- to bring the best personal computing products and support to students, educators, designers, scientists, engineers, businesspersons and consumers in over 140 countries around the world.

Apple, the Apple logo, Mac and Macintosh are registered trademarks and iMac is a trademark of Apple Computer, Inc. Additional company and product names may be trademarks or registered trademarks of the individual companies and are respectfully acknowledged.

Of course the jihads will claim that fire wire, faster bus, gorgeaous case, the inclusion of ATI ridge 128 and lower price doesn't count because the milan and hades hardware is still superior and will be forever...

Apple Launches Reinvented Power Macintosh G3 Line

New Line Has Fastest PowerPC Processors, Lightning Fast 3D Graphics and Aggressive Prices

SAN FRANCISCO, MacWorld Expo, Jan. 5 /PRNewswire/ -- Apple Computer, Inc. (Nasdaq: AAPL - news) today introduced a completely new line of its highly-successful Power Macintosh® G3 computers, which feature new copper-based PowerPC processors running up to 400MHz and the industry's newest and fastest 2D-3D graphics accelerator chip -- the just released ATI RAGE 128. The new G3s also include industry-standard 10/100BASE-T Ethernet, USB and 400 Mbps Firewire -- all on the motherboard. Housed in a stunning translucent minitower enclosure with a revolutionary access mechanism that simplifies access and expansion, the new Power Macintosh G3 line starts at an aggressive suggested retail price (SRP) of U.S. $1,599.

``The original Power Macintosh G3 was a tough act to follow but we've done it with a new line that crushes the competition with its raw power, graphics performance and industrial design,'' said Steve Jobs, Apple's interim CEO. ``The new Power Macintosh G3 raises the bar on what people should expect a personal computer to offer.''

By combining a Power Macintosh G3 with one of Apple's new Studio Displays, customers can purchase the most complete Macintosh® system ever. The new Power Macintosh G3 line is perfect for design professionals who want to run the most powerful image-editing packages, home users looking for a machine that can handle the latest in graphics-intensive games and Internet applications, and educators who want a high-performance machine that is a solid investment for the future. With over 1,300 new software titles launched for Macintosh in the last eight months, the new Power Macintosh G3 line is designed to run the latest software at lightning speeds.

Key features of the new Power Macintosh G3 line include:

The fastest PowerPC G3 microprocessors yet -- running at 300MHz, 350MHz, and 400MHz, with support for up to 1 GB of DRAM in 4 DIMM slots ATI RAGE 128 graphics controller with 16MB SDRAM graphics memory and support for QuickDraw 3D RAVE and OpenGL -- making the latest games, graphics and video editing software stand out Translucent blue and ``ice'' minitower enclosure that provides the industry's easiest access to expansion slots and memory

Two 400Mbps FireWire ports and two 12Mbps USB ports to connect the latest cameras, printers and storage devices; USB keyboard and mouse 100MHz system bus for fast data through-put Increased expansion options through three 64-bit 33MHz PCI slots; one 32- bit 66MHz PCI slot for graphics Fast networking through 10/100BASE-T Ethernet Storage choices including Ultra ATA-33 and Ultra2 SCSI LVD hard drives ADB to support customers' current displays and add-ons

Pricing and Availability

The new Power Macintosh G3s are available immediately via The Apple Store (www.apple.com) and Apple Authorized Resellers, with over ten thousand build-to-order (BTO) configurations, including industry-first options for DVD-RAM optical storage and soon to be available 100GB of disk storage and Gigabit Ethernet communications. The following standard configurations are also available worldwide through Apple resellers and The Apple Store:

Power Macintosh G3 - U.S. SRP $1,599 300MHz/64MB DRAM/512K level 2 backside cache/ATI RAGE 128 with 16MB Video SDRAM/6GB Ultra ATA hard drive/24x-speed CD-ROM drive (maximum)/FireWire/USB/10-100BASE-T Ethernet Power Macintosh G3 - U.S. SRP $1,999 350MHz/64MB DRAM/1MB level 2 backside cache/ATI RAGE 128 with 16MB Video SDRAM/6GB Ultra ATA hard drive/DVD-Video/FireWire/USB/10-100BASE-T Ethernet Power Macintosh G3 - U.S. SRP $2,499 350MHz/128MB DRAM/1MB level 2 backside cache/ATI RAGE 128 with 16MB Video SDRAM/12GB Ultra ATA hard drive/24x-speed CD-ROM drive (maximum)/ZIP/FireWire/USB/ 10-100BASE-T Ethernet Power Macintosh G3 - U.S. SRP $2,999 400MHz/128MB DRAM/1MB level 2 backside cache/ATI RAGE 128 with 16MB Video SDRAM/9GB Ultra 2 SCSI 7200rpm hard drive/24x-speed CD-ROM drive (maximum)/FireWire/USB/10-100BASE-T Ethernet Two new Macintosh Server G3 configurations are also available and include a license for AppleShare IP 6.1; a ten-client license for Apple Network Assistant 3.5; and, SoftRAID 2.5.1 for enhanced performance and security through striping and mirroring of hard drives. BTO options are also available. Standard configurations include: Macintosh Server G3 - U.S. SRP $3,299 350MHz/128MB SDRAM/1MB level 2 backside cache/ATI RAGE 128 with 16MB Video SDRAM/9GB Ultra2 SCSI 7,200rpm hard drive/24x-speed CD-ROM drive maximum)/FireWire/USB/10-100BASE-T Ethernet Macintosh Server G3 - U.S. SRP $4,999 400MHz/256MB SDRAM/1MB level 2 backside cache/ATI RAGE 128 with 16MB Video SDRAM/2x9GB Ultra2 SCSI 10,000rpm hard drives/24x-speed CD-ROM drive (maximum)/FireWire/USB/10-100BASE-T Ethernet

Apple Computer, Inc. ignited the personal computer revolution in the 1970s with the Apple II, and reinvented the personal computer in the 1980s with the Macintosh. Gee, maybe that should be Apple's new advertising slogan... "If you loved your mother, you'd buy her an iMac." Either that or "Think Different, Crash Often." :-) Just a harmless joke to those reasonable Mac fans out there. I'm anxious for the PC clone makers to start knocking off the iMac.

ironically, for once I actually AGREE with TIFKAS on this.

Harris is an idiot, a liar, and a bully. He and his Regressive
Conservatives got in power making a number of tax cut promises, but
also said that they would keep their hands off education and health
care (in the latter, they said they would not "touch a single penny" on
health care). When they got into power, guess what they started slashing?

They responded to one public service strike by having a police
force start busting heads. They created a crisis in the education
sector by actually cancelling all teacher contracts. Their shutting
down hospitals has lead to long lineups in emergency wards, and in the
last week has led to two emergencies where patients were flown to other
hospitals hundreds of miles away. They amalgamated the city of Toronto
into one big megacity - against the city's wishes, even after a
referendum held by the city soundly rejected any megacity plan!

Harris also is well known for putting his foot in his mouth -
witness last year, when they cut supplement payments to welfare mothers
on the grounds that "at least it won't be going to beer" - as well as
being two-faced - telling an audience in New York that our education
system "was one of the best in the world", and then later the same week
telling the legislature that we had "the worst education system in the
world".

The election is coming up this year, and even before the election
has been called, the Harris machine has ALREADY started attack ads
againts Dalton McGuinty, the leader of the Liberal party and the
official opposition - I suspect that, knowing that their goose is
cooked, the PCs have to make McGuinty the official Ontario boogeyman.
What makes it worse is that they're using taxpayer's money to do it.

And speaking of taxpayer's money - the government recently shelled
out money to pay for former legislature speaker Al MacLean's sexual
harrassment suit - $750,000 CDN, to be exact. Part of this went to a
private eye that MacLean hired to spy on the woman suing him, who was

also found to be starting a disinformation campaign about the woman with her neighbors.

Harris is hinting that the campaign for his re-election will be "the year of the Middle Class" - but here, it'll go down as "the revenge of the working class". Not ONE person I talk to at work, on the street, or in TAF, has a kind word to say about Harris, the PCs, or their policies.

Now that I've got that off my chest, back to talkin' bout computers. Guess we'll find out at MacWorld about the announcement that will make the iMac less overpriced and less underpowered.....

A message from the other side of the world (civilized part)

Mr Sinclair bragged about:
>iMacs with five new colors.

Sinclair, I've bought a TT eight years ago, and it has some
features wich the ImAc doesn't have......

1. reliable (where will the ImaC be in 5 years?? , recycled
into a naturefriendly PCB-free COLORED toiletpot)

2. tested and proven technology (throw the Imac in a river
and see what happens, now take a Atari and throw it in the
same river; have you noticed the difference ?? You didn't ?
don't worry in next weeks posting I'll tell you. In the
meanwhile a G3 threehunderd and a bit Mhz should be just about
able to solve the question in a week time, that's if it doesn't
overheat of course.

3. A.A.C.S.S ==> Atari Automatic Color Shifting System
wich is patented worldwide. I gues in a couple of days
the lawyers of HASBRO will file a suit against APPLE wich
will put them out of business once and for all.....
Unless uncle Bill G. steps in once again and saves them

You never heard of A.A.C.S.S ?? well let me tell you:

When I bought the TT it was housed in a white case, after a
couple of years it gradually shifted to creamy white, two years
later the creamy white turned into a nice dark creamy vanilla,
at the moment it has a nice light brown tobacco color, wich matches
the colorof my pipe almost perfect. Perhaps next month it will turn
to blue (grape) or yellow (lime) who can tell.
AACSS => constantly changing colors, covering the complete spectrum.

Signing of ... for now

atasoft@atari-computer.com (Belgium)

"There's always room for one more said the director of the
loony asylum"

PS 1: A couple of years ago Apple bought 10,000,000 sunglasses for
a big publicity-stunt in North-Europe. Nobody wanted them because
it always rains down there. So Steve Jobs once again got a brilliant
idea let's melt the whole lot and turn them into iMac-cases.
>the new iMacs will again change the rules of consumer computing by >letting consumers
select something they can choose

RECYCLED NATUREFRIENDLY SUNGLASSES

PS 2: Apple has got a couple of warehouses full with unsold 5200's.
In exactly 14 months and three days Steve Jobs will once again have
a brilliant idea (that's what he gets paid for), lets melt the whole
lot an turn them into.....(come to this group on 9th march 2000)

....
....

http://www.techweb.com/wire/story/TWB19990106S0008

Macworld Kicks Out Intergraph
(01/06/99, 3:28 p.m. ET)
By David Richards, Computer Reseller News
SAN FRANCISCO -- The organizers of Macworld Expo, held here, have stopped workstation manufacturer Intergraph Computer Systems from displaying Intel-based systems at its booth.

Intergraph, whose booth is located next to Apple's on the show floor, was set to demonstrate new Intel Xeon workstations running at 400-MHz and 450-MHz chips on Microsoft Windows NT-based multiprocessor workstations.

Sources said this conflicted with Apple's focus on its next-generation family of Macintosh G3 desktop systems, which are designed to compete with NT machines.

"We warned Intergraph prior to arriving that they could only run a Mac-clone environment running off an Intergraph Windows NT server," said Colin Crawford, president and CEO of Macworld Expo, a unit of IDG Expo Management Company. "What they turned up with was Windows NT workstations expecting to run them in a Mac-only environment. This was a sensitive issue: Apple didn't want it, I didn't want it, and we had to negotiate on it."

"It was unethical of them to turn up at a Mac function trying to woo Mac people to a Windows NT platform," Crawford added. "They were warned and now they have been banned. It is not our fault." IDG refused to comment.

But an IDG insider who asked not to be named said Intergraph would be compensated for having to leave because IDG feared a lawsuit. The source also said IDG enforced a clause in the contract that gave IDG the right to remove from Macworld anyone it deemed wasn't acting in the interest of the event. During his keynote Tuesday, Apple interim CEO Steve Jobs boasted about a powerful new 400-MHz G3 workstation, comparing it to an Intel-based workstation similar to what Intergraph was planning to demonstrate.

An Intergraph employee, who asked not to be identified, was skeptical about Jobs' demo.

"I would like to run the demo again on our systems, this time running ours or SGI's [Silicon Graphics Inc.] proprietary accelerator cards," the Intergraph employee said. When asked whether it was good business sense to market NT workstations to Mac users, Macworld's Crawford said, "It may be smart in their eyes, but I think it is plain dumb at a Mac function. I was under pressure from Apple, and we had to act."

This is not the first time Intergraph has used Macworld to attempt to lure Apple's core user base -- publishing, graphics, and design professionals -- to its workstations.

At both Macworld events last year, Huntsville, Ala.-based Intergraph stationed company representatives at many nearby hotels and on corners to pitch its products as an alternative to the Mac.

Hiya there Apple sales rep. Well, after happily recommending Apple products to people that are contemplating purchasing a personal computer for almost two decades, I've not only stopped doing so, I've started making it a point to bring up the disadvantages of having one in their home. Do I dislike Apple? Nope, I dislike your attitude. My protest will not seriously hurt Apple in and of itself, but I get immense personal pleasure knowing that you've lost the company yet another sale. Hey, amongst the people I know and work with, it only works out to an average of three to four computers a month, but it's a start.

Terry Ross

^^^^^^^^^^
>shreds library book..

I DON'T BELIEVE IT! TIFKAS HAS CALLED A MACINTOSH JUNK!

A Mac IIci, TIFKAS, turned out to be just what my mother needed -
ands she thanked me profusely for being so thoughtful for her Christmas
present. It fits her needs quite nicely - upgradable to 128mB RAM, uses
SCSI, colour, fast enought to run ClarisWorks, usable with her printer.
Gee, even Apple mentions the IIci still on their web site
(http://www.apple.com), and on comp.sys.mac.advocacy (you know, the
place TIFKAS is too cowardly to post his drivel to because he'd be
rendered Cajun-style in seconds :)) there was a thread about the
feasability of using a IIci as a web machine (concensus - more than
adequate with enough RAM) by actual Mac users with brains.....

The above, I see, speaks buckets about what TIFKAS thinks - "if it's
old, it's no good, throw it away and spend thousands on the next big
thing". Which is miles away from my attitude - "if it still works, and
it fits your needs, it's still got a use". It's attitudes like TIFKAS'
which leads to wasteful behaviour like throwing away entire computer
systems in skips and the trash, when they can be donated to schools or
even to places like Goodwill where someone who can better appreciate
what an older computer can do can make better use of them.

BTW, it's spelled "cheapskate". Guess you were under the table at
Pub 101 when spelling class was on......

>> my mother wound up loving the Internet the minute she first got her
>> hands on it - at my brother's house on his Macs. In fact, it came in

>> search, we found the entire manual online!
>
>If you loved your mother you should of gotten her an iMac....now in five
>flavors..no pink yet...-)...

an iMac is something my mother DOESN'T want, believe it or not. She
recognizes how crippled the system is, and it won't work with her
existing hardware, or allow her to access her many floppy disks without
having to shell out mucho dinero for something that should have been
standard in the first place. Her IIci, OTOH, will work out just fine.

BTW, my mother also thinks you're an idiot.....

So, new colours - I guess if you can't sell the steak, sell the
sizzle. New colours will certainly expand the Steve Jobs
Reality-Distortion Field to cover the now-less-overpriced,
now-less-underpowered iMac's flaws.

BTW, Apple missed the boat - no basic black? And why no real
Apple colours, like red or solid green?

>He he he...I have been busy for the last two weeks and already missed. From
>the looks of the number of posts, time for sinclap to come back..

.....and get his virtual little hiney kicked.....

If thats her main use she does not need anymore unless she does a lot of
internet surfing. Like utilizing java and QT. I am a PowerUser, so my needs
are greater..

Apple Works 5 just needs an 020 to run. Quite amazing that updates require
the bare minimum compared to MS Office releases..

> The above, I see, speaks buckets about what TIFKAS thinks - "if it's

I still stand by my view is that old computers like the CI's and 286, 386 and 486 should not be donated or be rejected if being donated...

Schools should have technology plans in place that have rational upgrade cycles so they won't be left behind. I have been in many schools were video production and media is used extensively.

Thats a compliment..Means I am doing my job.. The iMac is no more crippled than a ci..Now that the iMac starts at $999!

And to [sic] bad, your precious Mac cannot teach you how to spell and use
grammar correctly.

Try "too bad", and then flame others for their writing.

Now complete the following:

People living in a house of glass.....

Oh, and I'm not a fan of Ataris (no offense to the Atari fans here), but I
don't spend the best years of my life like you, annoying people for their
choice.

> Soon to be issued a PB G3/266 to replace PB3400!

And which I hope tha helps you in:
1. Getting a clue.
2. Learning more about computers.
3. Finidng better things to do other than whining in advocay newsgroups about
conmputers that you don't use, and to be more specific to leave teh Amiga and
Atari newsgroups as you are a public annoyance to the people.

Hope this helps.

Aram Iskenderian.

>
>Until now..He will be licking the boots..

this from our favorite boot-licker (especially Steve Jobs') :)

Chrietien (aka Da Little Guy From Shawinigan) is probably best
remembered for two things as his career as PM:

1) actually THROTTLING a protestor who got in his way at a
walkabout (and while wearing shades and black leather gloves!).

2) when an intruder got inside the PM's residence a few years back
with the intention of killing him, Chrietien was waiting for him with an
Indian soapstone carving as a weapon.

Does your gov. feel LUCKY? Does he, PUNK?

>> Your gov. may be tough, but he'll have to get past the pepper spray
>> first :)
>
>Navy Seals have taken pepper spray training..

so your gov. has to rely on Navy Seals to protect him? What a wimp!
So much for defending himself against our PM mano et mano...

and as for your jingoism - remember, the last time the US made the
mistake of picking on Canada (The war of 1812) their forces had their
butts handed back to them on a platter with mint sauce on the side :)

Of course, we all know how weak you are on political science -
just look at the impeachment. So much for your "the president can only
be impeached for treason" screed.

[snipped]
>
>It's advocacy...Get Over It!

Precisely. It's advocacy. And I'm advocating that they don't put their money into Apple. My advocacy, incidently, has a lot more impact than yours, since I am talking to people that are actually considering purchasing a computer, and have questions. Whereas, yours is simply a matter of putting down the choice of what people have already spent their money on and are perfectly satisified with.

>Do you recommend the Milan beige box?

Let me put it like this. I don't recommend a Milan to the people that consider the color of their computer to be a significant factor. I have recommended a Milan, (or Hades, or used ST/TT/Falcon - or even Amiga) to people that understand that a computer is a tool and have expressed a desire for an alternative to Macs/Wintel boxes. The point is, I don't recommend Apple anymore, regardless of its intrinsic values, due to your attitude and generally robotic, brain-dead, "pick-an-answer-from-your-list-of-prewritten-comments" responses to anything posted on c.s.a.advocacy. So, you keep "advocating" here, where nobody is even vaguely interested. I'll keep advocating in the real world, where people have their wallets out, waiting to spend their money.

>I still stand by my view is that old computers like the CI's and 286, 386 and
>486 should not be donated or be rejected if being donated...

again, a sign of TIFKAS' waster mentality. You'd be surprised how
many of these "old, useless computers" can be placed to good use not
only in schools but also in the homes of the underpriveliged and needy.
There are many agencies in the US and Canada that often ask for and
receive the "old, useless technology", and put it to best use rather
than have it emolder in a landfill....

>
>Schools should have technology plans in place that have rational upgrade
>cycles so they won't be left behind. I have been in many schools were video
>production and media is used extensively.

but what if they don't have the BUDGET?

at the last Comdex here in Toronto, there was an organization called
Computers For Schools whose goal is to get computers into schools who
don't have much to spend on for a computer-learning budget - they will
take even 286 computers, because they've gotten a special licence from
the makers of what was originally called GeoWorks to install their
operating systems on - and beleive me, these computers run like a
little powerhouse. They've even included e-mail, USENET and WEB SURFING
to the new version.

As for 386s - well, I believe that a donated 386 system with Linux
installed would make a great little computer for future programmers in
high schools to get started on....

oh? To pop a big hole in the Steve Jobs Reality-Distortion Field?

Steve Jobs did a demo that Intergraph saw were huge holes in it.
Intergraph was prepared to do a demo that threatened to blow away the
new Mac servers. Jobs had one of his oh-so-famous hissy fits and had
Intergraph (who had an agreement to be at the show) kicked out....

Gee, which part of that couldn't you understand?.
>
>Goto PCExpo, Comdex or Amiexpro or maybe a once in a decade Atari show...

gee, last Comdex I was at, Apple was conspicuous by their absence. I
don't see why they would bother to be at PC Expo. Apple does sometimes
show up at the twice-yearly Neuss show in Germany to try to sell the
points of running Atari emulators on their Macs (which I'd suggest
you'd go and visit after you extricate your foot from your mouth....)

as usual, TIFKAS is clutching at straws. So he now stoops so low as to suggest that users of the now-less-overpriced, now-less-underpowered iMac solve their lack of game software problem by using a Sony Playstation emulator.

Here's the problem, though:

1) the Playstation Emulator costs $90 US - and won't run all of the "hundreds of Playstation games". A REAL Sony Playstation, OTOH, costs from $90-129 US NEW (depending on which package you buy) and runs 100% of ALL Playstation titles. Now what is the better value?

2) in order to use the Playstation emulator, you must obtain a GENUINE PLAYSTATION OS ROM DUMPED TO DISK. The only legal way you can do this is if you actually OWN a Sony Playstation (again, $90-129 US - KA-CHING!). Do the math - is it better to just pay $90-129 US for a genuine Playstation that is 100% compatible with all games, or to spend $180-219 US to run a not-100%-compatible emulator on an iMac?

2a) those of the emulator's users who would forego #2 and actually PIRATE the ROM will soon discover just how much a sense of humour Sony's army of patent lawyers lacks (and last time I looked, software piracy/breach of copyright carries stiff fines, stiffer prison sentences, and potential lawsuits from the patent owners). Is it really worth it?

As usual, TIFKAS is a penny short, a pound foolish, and (like many Mac game titles) a year late!

>
>-----------== Posted via Deja News, The Discussion Network ==----------
>http://www.dejanews.com/ Search, Read, Discuss, or Start Your Own

see, TIFKAS is so clueless, he relies on a "NEWSwatcher USENET Reader Emulator" rather than set up the real thing. But then, when you have the collective IQ of a bag of pork rinds.....

3181. Sony spoils TIFKAS' "good news"

Newsgroup: comp.sys.atari.advocacy
Date: 1999-01-09 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <3697e7cb.0@nemo.idirect.com>
Source record: 3992

well, it now looks like Sony has now made their move against the
Connectix Playstation emulator for the now-less-overpriced,
now-less-underpowered iMac mere DAYS after its release at MacWorld....

Grabbed from PSX.IGN.COM the Playstation News Page

"With an unsurprising stomp of the boot, Sony is filing an injunction
against, and will then sue, Connectix. With much fanfare at the recent 1999
MacWorld Exposition, the codesmiths at the company well known for RAM
Doubler and other products, announced their commercial PlayStation emulator,
the Virtual Game Station, to the surprise of many. Especially Sony. But
within two days of the show, a Sony representative allegedly purchased two
of the units, and within a mere two days, the company plans Sony formed the
backbone of its suit. Sony will sue for intellectual rights infringement on
the illegal use of its patented game system."

and somewhere out in the US, TIFKAS (The Idiot Forever Known As
Sinclap) is having a meal of crow - that is, as soon as he can get BOTH
feet out of his mouth.... :)

I take it you're saying that he was, at one time, a Navy SEAL. I'm curious, does he go around yelling "WhoooooYahhhhhh!!!" at inappropriate times and bumping into walls like a large percentage of the Navy SEALS I know are likely to do?

Not to impugn the actual traing of the SEALS, which is admirable, for the tasks assigned - but knowing quite a few of them, they're not exactly the brightest lights on the Christmas tree.

300-, 350-, or 400-MHz PowerPC G3
processor
512K or 1MB backside level 2 cache on
processor, running at 150, 175, or 200
MHz depending on processor speed
100-MHz system bus
Integrated floating-point unit and 64K
on-chip level 1 cache (32K for data and
32K for instruction)

Memory
64MB or 128MB of PC100 SDRAM
(3.3-volt, unbuffered, 64-bit-wide,
168-pin, running at 100 MHz)
Four DIMM slots support up to 1GB of
PC100 SDRAM using the following
DIMMs:
•32MB, 64MB, or 128MB DIMMs
(64-bit-wide, 64-Mbit technology)
•128MB or 256MB DIMMs
(64-bit-wide, 128-Mbit technology)

Storage*
One of the following:
•6GB Ultra ATA hard disk
•12GB Ultra ATA hard disk
•9GB Ultra2 LVD SCSI hard disk with
Ultra2 LVD SCSI PCI card
24x-speed (maximum) CD-ROM drive; or
5x-speed (maximum) DVD-ROM drive
with DVD-Video playback (reads
CD-ROMs at up to 32x speed)
Zip drive (some configurations)
Two additional expansion bays for Ultra
Wide SCSI, Ultra2 LVD SCSI, ATA

(IDE), Ultra ATA, or ATAPI drives (including CD-ROM, DVD-ROM, and Zip drives)

Interfaces
Connectivity
• Two 400-Mbps FireWire ports
• Two 12-Mbps Universal Serial Bus (USB) ports
• Apple Desktop Bus (ADB) port (maximum current draw for all ADB devices is 500 mA)
Communications
• Built-in 10/100BASE-T Ethernet connector (RJ-45)
• Optional internal 56K modem card (supports K56flex and V.90 standards)**
Expansion
• Four PCI slots: three 64-bit, 33-MHz slots and one 32-bit, 66-MHz slot dedicated to the ATI RAGE 128 graphics card
Video
• 15-pin mini D-Sub VGA connector and Macintosh-to-VGA adapter
Sound
• Minijacks for 16-bit stereo audio input and output; 44.1-kHz sampling rate
• Built-in speaker

Graphics support ATI RAGE 128 graphics card with 16MB of SDRAM graphics memory, which provides the following capabilities: 2D performance • 128-bit internal engine • Hardware acceleration of graphics and video • Support for up to 1,920- by 1,200-pixel resolution at 32 bits per pixel (millions of colors) 3D performance • Advanced integrated triangle setup engine • Single-pass multitexturing design • Full 32-bit-per- pixel (bpp) Z buffer and 8-bpp stencil buffer • Robust support of QuickDraw 3D RAVE and OpenGL

I doubt that many ST jihads were aware that there are multiple Atari shows.
Please post the schedule..Maybe there will be one in the Twin Cities soon
right around were I live in Eden Prairie...

> be impeached for treason" screed.

You can impeach a salami sandwich... The President was impeached by partisan Repubs who hate Clinton's generation... Will be upto the cooler heads in the Senate to acquit or convict..The first will be likely..

> than have it emolder in a landfill....

It's not wasted mentality but prudence.. Fine they belong in the homes of the
needy and the less priveliged ones but not in the schools who are serious
about education. Students are power users unlike a certain jihad clan that
sticks to the past..

> >
> >Schools should have technology plans in place that have rational upgrade

They can have the budget they plan and sell it to the community. Many schools
who take education seriously instead of sports will get the money through
increased property taxes, levies or generous alumni..

> at the last Comdex here in Toronto, there was an organization called
> Computers For Schools whose goal is to get computers into schools who

> to the new version.

Doesn't solve anything...what about multimedia. Schools use MULTIMEDIA...A
286, a 386 and 486 or 68k Mac will not cut it..

> As for 386s - well, I believe that a donated 386 system with Linux

Apple took the bondi-blue off MAP according to the news organizations. Thats
means retailers can charge what they want. CompUSA has it priced at $999 now.

> >
> >Customers asked for color choices..

> Here is the substance..Not like the Milan using yesterdecade tech...

Hmmmmm, here is some more 'substance' -

I finally broke down - and bought, on Jan 2, a non-iMac Mac G3-233 with 96mb of RAM and OS 8.5 - on Jan 6th it went back to 'the shop' where, after 48 hours, they finally told me the 'logic board' needed replacement - I hope - I reaaaaaly hope - I haven't bought trouble - my Atari Mega/STE has been running since 1991 without service other than to replace the ROM OS (upgrade only) and reseat the chips last year -

Tell me, pleaaase, this is not a standard game on Mac - the Macs at the office were less prone to troubles than the PeeCees - has that changed.

And, when I get it back, I'm going to be searching for an Atari emulator - some of the Mac software is bloated crap compared to Old Atari software

The Canadian Curmudgeon (in almost sunny, -3C, Calgary)

Yesterdecade tech with better engineering will always
likely trump the latest and greatest that's all style
and no substance.

[deletia]

BTW, those weren't hardware specs for iMacs.

So, you felt it necessary to PROVE to everyone that you either can't read, period - or that the mechanics of actually comprehending what you've read is beyond your grasp? It really wasn't a requirement that you attempt to prove my hypothesis you know, we're all quite aware that you've got the intellectual facilities of your average head of cabbage.

Better cut your fingers off there guy.... old tech... toss your
heart... chop off your head... oh, wait, on you that qualifies as a
vestigial organ anyway....

> Processor 300-, 350-, or 400-MHz PowerPC G3 processor 512K or 1MB
backside level 2 cache on processor, running at 150, 175, or 200 MHz
depending on processor speed 100-MHz system bus Integrated
floating-point unit and 64K on-chip level 1 cache (32K for data and
32K for instruction)

Gee, almost fast enough to convince people you're not running your
bloatware on a 286. Maybe in 15 years you'll have something fast
enough to make it worthwhile.

>
> Memory
64MB or 128MB of PC100 SDRAM (3.3-volt, unbuffered, 64-bit-wide,
168-pin, running at 100 MHz) Four DIMM slots support up to 1GB of
PC100 SDRAM using the following
DIMMs:
•32MB, 64MB, or 128MB DIMMs (64-bit-wide, 64-Mbit technology)
•128MB or 256MB DIMMs (64-bit-wide, 128-Mbit technology)

Yup... too bad it's necessary.... don't you hate having your simple
4-function calculator require 6 megabytes of memory, and an additional
2 megabytes for the help file? Does it occur to you that entire
governments were run on 32K systems? What does that tell us? Simply
that your Macs must be pretty darned inefficient there fella.

> Storage*
One of the following:
•6GB Ultra ATA hard disk
•12GB Ultra ATA hard disk
•9GB Ultra2 LVD SCSI hard disk with
Ultra2 LVD SCSI PCI card
24x-speed (maximum) CD-ROM drive; or
5x-speed (maximum) DVD-ROM drive
with DVD-Video playback (reads CD-ROMs at up to 32x speed)
Zip drive (some configurations)
Two additional expansion bays for Ultra
Wide SCSI, Ultra2 LVD SCSI, ATA
(IDE), Ultra ATA, or ATAPI drives
(including CD-ROM, DVD-ROM, and Zip drives)

I'm impressed.... that should suffice for your bloated Operating System - what devices are available for actually storing applications & data? Do you even know what a gigabyte is? Why in the name of Charles Babbage do you think you need that much storage space? Because you've got a monster on your hands that will continue to suck up anything you throw at it. I'm waiting for the day when your 3-Terabyte drive drive crashes, forcing you to use a pen and paper because you've lost your word processing App.

Oh, there are lots of them, and people want them. See, PC's and Macs
decided to embrace bloatware where you can't even display an ASCII
text file in a reasonable amount of time without a 500mhz Alpha chip
so the 060's have been used by the companies who actually know how to
make a computer and OS.

No Problem. The image works fine. 4Mb RAM machines might choke due to the
sheer size of this image but who is stupid enough to put 1500x1200 odd size
JPEG
images on a webpage anyway! All that does is waste bandwidth...

regards,

Chris Wilkinson,
/|\ ATARI Falcon030 14Mb/32MHz

3200. New G3 Mac's look the business.

Newsgroup: comp.sys.atari.advocacy
Date: 1999-01-11 00:00:00 UTC
From: spencer@SPAMTHISmaelstrom.freeserve.co.uk

Source record: 3812

Sorry to lower the tone of the conversation but has anyone seen the
new Apple G3 minitower? Wow, now there's a nice piece of kit. If only
you could get it in different colours like the iMac and it was 100%
compatible with the PC I might have bought one!

For the moment I shall have to stick with my P133 and TT.

Also has anyone read "APPLE - The Inside Story of Intrigue, Egomania,
and Business Blunders" by Jim Carlton? Apart from his, at times,
obvious religious Apple furvour it is a great read. Just how similar
can Atari and Apple get in their day to day dealings!!!

Spencer

3202. Crap sound from 1040STfm

Newsgroup: comp.sys.atari.advocacy
Date: 1999-01-11 00:00:00 UTC
From: Clockmeister <gerryvdb@tnet.com.au>
Message-ID: <01be3d8a$d87e7560$5a5e0fcb@default>
Source record: 3814

What soundchip does the 1040STfm use?
More importantly, why is the sound output more like that of a C64 then an Amiga?.

MODs sound awfull, as does game music when compared to the same game versions on the Amiga (Xenon II megablast for instance). Did the STfm use the same soundchip as the 520ST's?.
I'm curious because I thought that even early Atari's had great sound output, which is obviously not the case.

Can anyone shed some light on this subject for a Amiga user who has recently aquired a 1040STfm?.

I was going to use it as a MOD player but that seems pointless.

Regards,

Clockmeister.

The problem Dick...er sorry! Peter, is that you have no idea how fast -any-
accelerated Atari running modern system software (N.aes, MagiC, Mint) is...

It doesn't take kazillions of CPU cycles just to open a window, or move a
file. Unlike some bloated memory hogging OS's I won't even mention here. ;-)

BTW, did you know that work is -continuing- on the 68K line? An 80mhz '060
is supposed to be released soon.

->Thats news to me...And Why? Anything new comming out or is it for nastalgia?

I figured it would be...clues for the clueless... ;-)

Of course there is new stuff coming out. There is, and has been year in and year out for a long time. (don't have enough time/space to list it all) ;)

Why? Because us loyal "Jihads" won't quit on a good thing! (Atari-its more than just a computer-its a way of life!)

BTW, its nostalgia...(iMac reps obviously can't spell as well as not being able to accept reality) ;-))))

->I doubt that many ST jihads were aware that there are multiple Atari shows.
->Please post the schedule..Maybe there will be one in the Twin Cities soon
->right around were I live in Eden Prairie...
->
->Peter S.

I'm sure most the "Atari Jihads" are aware-we were didn't want to tell, afraid that you might show up, and somebody would vaporize you to put you out of their agony... ;-)))

Anyways, lets see...there was the Deuce show, held by A.U.N.T, which just occurred in November of this year. There were 2 shows in the UK recently, the big Atari show in Germany (messe?), as well as World of Atari '98. (and this is just off the top of my head-I'm sure there were more-with repeats this year) Get the point, O pointless one? ;-)))

A Yamaha chip, a FM or PCM synth, three channels, commonly referred to as
"blip-blop".

>More importantly, why is the sound output more like that of a C64 then an
>Amiga?.

Because the Amiga has got Paula, which is superior even to 16-bit PC
soundcards, due to advanced, reliable technology. The ST's Yamaha chip is more
like that of a Master System or other 8-bitters. However, the STE and the
Falcon had better soundchips, that of the Falcon even surpassing Paula.

>MODs sound awfull, as does game music when compared to the same game

>I was going to use it as a MOD player but that seems pointless.

It's quite pointless. The tracker module is essentially an Amiga format, and
doesn't work particularly well on any other platform.

Nevertheless, Java is in reality entirely uninteresting, albeit a nice idea in
theory. The only experience I have of Java in all my hours of surfing is that
the browser suddenly grinds to a halt, nothing happening for half a minute,
since some idiot decided to have a reflection of his logo on a web page.
Hence, I deactivate Java whenever I encounter such a browser.

Yep, they might be able to get their computers. However, that will lead to cuts when it comes to books, teachers and other material. You make it sound very easy, as you always do. You haven't got much experience of what it is like to manage finances, do you? You just get a new PB from your emplyer every six months, but not everyone does.

>> at the last Comdex here in Toronto, there was an organization called

>Doesn't solve anything...what about multimedia. Schools use MULTIMEDIA...A
>286, a 386 and 486 or 68k Mac will not cut it..

Schools don't use "multimedia". They use word processors. Sometimes, they even use web browsers and compilers for programming languages. Multimedia doesn't include playing MP3 music or Quake.

>> As for 386s - well, I believe that a donated 386 system with Linux
>> installed would make a great little computer for future programmers in
>> high schools to get started on....

>What about the non programmers.. I see Linux will do more harm than dos did..

The non programmers could actually learn a thing or two, especially if they are not confronted with just Windows, Windows, Windows wherever they go. Knowing how to start Windows and run Word isn't the same thing as knowing computers.

>> >Customers asked for color choices..

>> over things like floppy drives? How clueless can they get?

>Floppies are available..

Peter, you need but one stop at the end of a sentence. Your double stops do only indicate a vagueness, which of course is quite coreect when it comes to

you, Pete.

As for floppies, they are available, but they will do the iMac user no good, since he hasn't got anywhere to insert them. Remember, the IMac is a hermetically sealed environment without any chance of data exchange with the outside world.

I usually see them from $400-$600 dollar depending a memory, HD and any additionals included. Falcons and TT030's have held up in value. STacy laptops as also held up well, going for anywhere from $350-$500. Mega STe's are going for about $200-$250, Mega ST's for about $100-$200, 1040ST's for about $75 and 520ST's are usually $25 or free sometimes, they have next to no value.

An 060 coupled with an efficient, PMT OS and good system design is quite a
speedy solution. The Mac needs oodles of CPU power to compensate for that
pathetic OS known as MacOS.
Just why is it that an 060/50 based Amiga emulating a Mac approaches the
speed of a real PPC Mac?.

An 060 is a nice solution for both the Atari based and Amiga platforms and
the chip demand is surpassing supply by a fair margin.
Not to mention the fact that the 060 continues to be developed further,
mainly due to user demands.

The Atari ST sound chip is the same cheap old Yamaha FM chip that was used in the ZX Spectrum and Amstrad CPC. Even the C64's SID chip was far better than the Yamaha.

> MODs sound awfull, as does game music when compared to the same game
> versions on the Amiga (Xenon II megablast for instance). Did the STfm use
> the same soundchip as the 520ST's?.

Yes, of course it did. An STFM is just an ST with integrated floppy drive and RF TV output, nothing more.

The STE was the improved machine, where they fixed the weaknesses that the ST had compared to the Amiga. Among the other changes, the STE has a stereo DMA sound system comparable to the Amiga's, but it was too little, too late and very few game editors bothered to write STE enhanced versions of their games.

> I'm curious because I thought that even early Atari's had great sound
> output, which is obviously not the case.

No, they didn't. BUT they were great for professional music applications. Musicians use MIDI synths and expanders, and even though the Amiga had a better sound system, it was still useless for pro or semi-pro musicians who wanted rock solid MIDI.

>
> Can anyone shed some light on this subject for a Amiga user who has
> recently aquired a 1040STfm?.

The Yamaha soundchip was definitely one of the ST's weak points. As I said, they fixed it with better hardware in the STE.

For an idea of what the STE is capable of, you should try Obsession Pinball on an STE.

>
> I was going to use it as a MOD player but that seems pointless.

If you have an Amiga, then probably it is. Get an STE with Octalyzer or some other STE-only MOD tracker, and taste the difference.

Yep, and the Amstrad CPC.

<snip>

> However, the STE and the
> > Falcon had better soundchips, that of the Falcon even surpassing Paula.
>
> Which soundchip does the Falcon and STE use?. Is it a custom device or
> another Yamaha chip?.

The STE (and Mega STE/TT) have a custom Atari DMA chip. It was designed
specifically for playing stereo samples from Direct Memory Access, at
any sample rate. As I said in my previous post, it was hardly ever used
in any games. There are quite a few STE-only MOD players around that are
quite good.

In addition to that, the Falcon has a completely new sound system, known
as the "sound matrix" which allows you to send various inputs (mic, ADC,
DMA, etc...) and outputs (speaker, headphones, DAC, DMA..) through the
DSP. This allows to do things that couldn't be imaginable on the Amiga,
like harddisk audio recording in sync with MIDI, while adding effects
through the DSP. If only the DAC/ADC had been better, the in/outs would
have been at line level and the fixed clock rates would have been the
industry standard 44.1 KHz.

I'll keep my eye out for a STE then ;-)

Thanks for the info.

Regards,

Clockmeister.

>thereof at AmiTech, I too would be upset, although I suspect Petro
>Tyschtschenko and Amiga International would be more humble about it.

to here I disagree. Intergraph is a company that makes servers, and
their servers are very Mac friendly - hence their booth at MacWorld.
However, after hearing Jobs make another one of his fatuous claims -
this time about Mac OS servers being able to toast PC servers, and using
what Intergraph saw as a flawed test. Intergraph decided to do another
test at the show that compared their systems to the new Apple servers.

Now this would have been perfect for Apple had they been able to
substantiate their claims using another competing product - even if they
broke even, it would have given them some credibility as to their
claims. Instead, afraid of having a huge hole pop open in the
Reality-Distortion Field�, Steve simply had another of his infamous
hissy fits and used his leverage with MacWorld to have Intergraph
removed.

Indeed, the question remains - if Intergraph's actions and product
were not appropriate for the show, then why let them in the show in the
first place?

Jobs has not been getting good press over this. Indeed, it's making
him look quite bad. Here he is at a position where Micro$oft is in serious
loss of credibility, a situation where Jobs can make some great inroads
- the last thing he needs is to start using Gates-like tactics to
silence his critics.

3219. Wanted: A Stable O/S

Newsgroup: comp.sys.atari.advocacy
Date: 1999-01-12 00:00:00 UTC
From: Jeaux <jeauxblo@mindspring.com>
Message-ID: <77g39notf1@camel0.mindspring.com>
Source record: 3831
Cross-posted to: comp.sys.atari.advocacy,comp.sys.ibm.pc.soundcard.advocacy,comp.sys.mac.advocacy,comp.sys.net-computer.advocacy,comp.sys.next.advocacy,comp.sys.powerpc.advocacy,comp.unix.advocacy,de.comp.advocacy,de.comp.os.os2.advocacy

Wanted: a stable O/S for Intel oriented computers which will obselete the Microsoft Abominations.

[End User License Agreement: By opening this message you show your agreement to spend the rest of your life vigorously opposing the oppressive Microsoft marketing philosophy.]

The instability of Windows Operating System, and the inability of the operator to re-install major portions of the O/S without re-installing the entire O/S, maintains an ever-present menace to periodically flush out information, indescribably important to the user.

Backups are no solution in a market which produces ever-increasing hard drive capacities when Microsoft maintains perpetually expanding products which render the new capacities little more helpful than the older smaller drives.

Microsoft will not include proper correctional procedures as to allow the operator to correct the notorious anomalies which are guaranteed to crop up in the O/S, without phone contact to Redmond Washington. Neither the demur manual, NOR the on-line Help avails the correctional procedure to the Operator. For example, trying to look up the word "reinstall" in the help window yields no solution to reinstall some component of the O/S.

There is the option of calling Microsoft help personnel and paying long-distance phone charges to have them direct the operator through the esoteric steps of addressing the pertinent cabinet files, but this increases the price of Windows from $89.00 retail, to something on the order of $300.00 to $600.00 per year, to keep the O/S in its normal unstable operability.

Microsoft offers no 800 or toll-free numbers for help. Microsoft is such an oppressively wealthy company that it is publicly contemptuous for them to fail to offer toll-free technical support as do much smaller vendors who are much less able to afford this overhead. There should be an investigation to determine any collusion between Gates or Microsoft and Telecommuications Companies.

For Bill Gates to have $65 Billion (not a current figure) taken from customers for the shoddy unservicable products he has sold should be legally defined as theft. Gates' wealth if properly distributed could more purposely provide the new Apple "IMAC" computer to 65 million individuals. Apple Computers with their more conscientious marketing philosophy would

more ethically deserve the business.

The Microsoft product upgrade procedure follows a successful formula of releasing a shoddy, unreliable, unstable product, generating profound sums of capital wealth, followed by a corrective "upgrade", equally lucrative, which, although it may fix some former problems, includes so much new feature content (which will require an equally lucrative future corrective upgrade) with commensurate shoddiness and instability, that the use of Microsoft Software is a pattern of upgrading from one instability to another, ostensibly for the purpose of perpetually genereating regeneratively snowballing Income.

Microsoft products are not ingenious. They are normally complex application softwares which are made more complex through the inclusion of protective devices which insure the company and its founder that it will not miss a penny. Microsoft is obviously and definitively taking advantage of a market allegiance which exists for no other reason than that it has always released software prematurely for the purpose of getting to market ahead of competition. There cannot be the option of buying a shoddy product first, and then improving with the advent of competitor"s software, due to the high price of software, and the education curve of switching.

What is reliable in Microsoft"s products is the guarantee that you will spend more time wiping them than you will spend in the toilet during your lifetime. Tens of millions of users, perhaps hundreds, lose hundreds of man-hours each year compensating for Microsoft"s marketing philosophy.

Bill Gates has visited more trouble on mankind in 20 years than millenia of efforts by any villains, mythical or otherwise, such as Satan, Lucifer, Beetle Juice, or Ron Hubbard. One can only hope that Gates" damnation of humanity will not be eternal. Like so many other consumers, I have spent a hellfire of time compensating for a greedy marketing philosophy, oppressive of competition. Multiply this by the hundreds of millions of computers in existence to comprehend the extent of the inferno.

I have been in the process of adding a section on my web site for the Atari line of PC Compatible systems. I managed to track down some old black & white photos last week, and I scanned/posted them on my site yesterday.

I did manage to track down some information on the PC-1 system from a review in an old issue of COMPUTE! magazine. However, I can't seem to find any information on the other systems. Specifically, I am looking for the Processor type, RAM, expansion capabilities, etc. In a nutshell, I need all of the hardware specs.

The ABC N386sx laptop looks almost identical to the old Epson laptops that I used to service years ago. Can anyone confirm/deny that Epson built these systems for Atari?

Do any spec sheets exist for these systems? The specific models that I am looking for are the PC-2, PC-3, PC-4, PC-5, and ABC line.

Actually, the LinuxPPC people are working rather hard to
get Linux running and fully functional on iMacs.

Macworld Kicks Out Intergraph
^^^^^^^^^^^^^^^^^^^^^^^^^^^^

(01/06/99, 3:28 p.m. ET)
By David Richards, Computer Reseller News
SAN FRANCISCO -- The organizers of Macworld Expo, held here, have stopped
^^^^^^^^^^^^
workstation manufacturer Intergraph Computer Systems from displaying
^^^
Intel-based systems at its booth.
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

Intergraph, whose booth is located next to Apple's on the show floor, was
set to demonstrate new Intel Xeon workstations running at 400-MHz and
450-MHz chips on Microsoft Windows NT-based multiprocessor workstations.

Sources said this conflicted with Apple's focus on its next-generation
family of Macintosh G3 desktop systems, which are designed to compete with
NT machines.

"We warned Intergraph prior to arriving that they could only run a
Mac-clone environment running off an Intergraph Windows NT server," said
Colin Crawford, president and CEO of Macworld Expo, a unit of IDG Expo
Management Company. "What they turned up with was Windows NT workstations
expecting to run them in a Mac-only environment. This was a sensitive
issue: Apple didn't want it, I didn't want it, and we had to negotiate on
it."

"It was unethical of them to turn up at a Mac function trying to woo Mac
people to a Windows NT platform," Crawford added. "They were warned and
^^^^^^^^^^^^^^^^^^^^
now they have been banned. It is not our fault." IDG refused to comment.
^^^^^^^^^^^^^^^^^^^^^^^^^^

But an IDG insider who asked not to be named said Intergraph would be
compensated for having to leave because IDG feared a lawsuit. The source
^^^^^^^^^^^^^^^^
also said IDG enforced a clause in the contract that gave IDG the right to
remove from Macworld anyone it deemed wasn't acting in the interest of the

event. During his keynote Tuesday, Apple interim CEO Steve Jobs boasted about a powerful new 400-MHz G3 workstation, comparing it to an Intel-based workstation similar to what Intergraph was planning to demonstrate.

An Intergraph employee, who asked not to be identified, was skeptical about Jobs' demo.

"I would like to run the demo again on our systems, this time running ours or SGI's [Silicon Graphics Inc.] proprietary accelerator cards," the Intergraph employee said.

When asked whether it was good business sense to
market NT workstations to Mac users, Macworld's Crawford said, "It may be smart in their eyes, but I think it is plain dumb at a Mac function. I was
^^^^^
under pressure from Apple, and we had to act."
^^^

This is not the first time Intergraph has used Macworld to attempt to lure Apple's core user base -- publishing, graphics, and design professionals -- to its workstations.

At both Macworld events last year, Huntsville, Ala.-based Intergraph stationed company representatives at many nearby hotels and on corners to pitch its products as an alternative to the Mac.

Found it funny that no Apple G3's (or even iMacs for that matter) were represented in the new release of Lost in Space. All SGI stuff on the screen. I guess Apple and it's third party software providers just can't cut it in a professional enviroment. Does that mean Apple has no place in the future? I just happen to think, they didn't show Pennys room. Maybe there was an iMac in there being used as a fish bowl....

I found the movie quite pleasing. I grew up watching Lost in Space on the tube and wondered how bad it could be. There wasn't too much of anything, and enough to make it worth while to tape off my DSS to S-VHS for editing on my Falcon and Expose.

Mike

(I thought the Robot sucked, but the virtual interface was cool as was the rest of the hardware on the show).

Roflmao.....

Chunks please use a larger bib to wipe up the extra chunky risidue that is
proving difficult clean up...
Please get it done...What do you not understand?

Media Advisory

Colin Crawford Affirms Intergraph Computer Systems Participation at Macworld
'99 San Francisco

HUNTSVILLE, AL, Jan. 11,1999 • Colin Crawford, President / CEO Macworld
Magazine, officially stated today that rumors of Intergraph Computer Systems
being 'kicked-out' of Macworld Expo. were completely untrue.

"Intergraph Computer Systems' (booth #1817), was a welcomed exhibitor and
participated in the Macworld Expo, January 5-8, 1999. Their exhibit was in
complete compliance with the IDG/Macworld Expo show guidelines," stated
Crawford. "Intergraph Computer Systems, IDG Show Management, and myself have
always worked well together to deliver access to the latest computing
technology which complements the Macintosh user's experience. We look forward
to working together in the future."

Crawford added, "Intergraph has been a friend to Macworld and has done an
above-board, professional job of presenting its MacFriendly NT solutions to
this audience. I have a great deal of respect for their organization and the
efforts they have made to support the Mac environment."

"This is the third Macworld for Intergraph Computer Systems and a good
forum for demonstrating our MacFriendly(TM) solutions. Our team grew up in
the Mac culture and are very familiar and sensitive to the issues Mac users

face," said Bruce Sholes, executive director, Intergraph Computer Systems, Publishing and Prepress Division. "We focus on the integration of our NT systems and the Mac in one environment. Hence, our message has always been and still is integration, not migration. We appreciate the support of Macworld and the IDG show organizers in facilitating our presence in Macworld publications and events. "

Intergraph featured its MacFriendly solutions, including workstations and servers, for seamless Mac and NT connectivity at Macworld and demonstrated Macintosh-based systems networked to Intergraph's Windows NT-based InterServe(R) servers in a series of hands-on workshops. Intergraph's MacFriendly TDZ(R) 2000 ViZual Workstations were featured in a number of third party vendor booths throughout the exhibit floor including Miramar, MetaCreations, Canto, Macromedia, Digital Studio (art gallery), and Media4.

3239. Apple's quarterly earnings....

Newsgroup: comp.sys.atari.advocacy
Date: 1999-01-15 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <369f4760.0@nemo.idirect.com>
Source record: 3901

well, just to spoil TIFKAS' mindless postings of Apple press releases, here's Apple's quarterly earnings for first quarter, complete with figures for you all to chew on.

For the most part they did pretty good. However, you may also want to check out the US Securities commission report (http://www.sec.gov) to see the stuff mentioned as Apple's concerns as well, which balances out nicely. Apparently Apple has been taking a significant decline in one of their niche markets, education - they also admit in the report that while profits are up, the actual number of computers they sold last fiscal year declined over the previous one. Of course, this is mostly at the beginning part of iMac sales....

Subject: Apple Press Release--99/01/13 Apple Reports Fiscal First Quarter Profit of $152 Million

Good Day:

The following press release crossed over PR Newswire on Wedneday, January 13, 1999 at 1:30 p.m. PST. Thank you.

For Immediate Release

Apple Reports Fiscal First Quarter Profit of $152 Million

49 percent unit growth outpaces industry average

CUPERTINO, California<Jan. 13, 1999-<Apple Computer, Inc. today announced financial results for its fiscal 1999 first quarter which ended Dec. 26, 1998. For the quarter, the Company posted a net profit of $152 million, or $.95 per diluted share. These results compare to a net profit of $47 million, or $.33 per diluted share, achieved in the year-ago quarter. Revenues for the quarter were $1.7 billion, up eight percent from the year-ago quarter, and gross margins were 28.2 percent, up from 22.4 percent in the prior year. International sales accounted for 47 percent of the quarter's revenues.

The current quarter's results included a $29 million after-tax gain from the sale of 2.9 million shares of ARM Holdings plc. Without this non-recurring item, the Company's net income for the quarter would have been $123 million, or $.78 per diluted share.

Sales of 519,000 iMac (tm) computers in the quarter drove overall unit growth to 49 percent year-over-year. Ending inventory dropped to $25 million, which represents two days of inventory.

"Unit growth year-over-year was three to four times higher than the industry average," said Steve Jobs, Apple's interim CEO. "In addition, Apple ended the quarter with only two days of inventory, besting industry-leading Dell's seven days of inventory."

"Growing earnings combined with world-class asset management resulted in positive cash flow from operations of $223 million," said Fred Anderson, Apple's CFO. "Apple now has nearly $2.6 billion in cash and short-term investments."

Except for the historical information contained herein, the statements in this press release are forward-looking statements that involve risks and uncertainties. Potential risks and uncertainties include, without limitation, continued competitive pressures in the marketplace; the effect competitive and economic factors and the Company's reaction to them may have on consumer and business buying decisions with respect to the Company's products; the ability of the Company to make timely delivery of new products and successful technological innovations to the marketplace; and the ability of the Company to successfully evolve its operating system. More information on potential factors that could affect the Company's financial results is included in the Company's public reports filed with the SEC, including the Company's Form 10-K for the 1998 fiscal year, and the Company's Form 10-Q for the quarter ended December 26, 1998, to be filed with the SEC.

Apple Computer, Inc. ignited the personal computer revolution in the 1970s with the Apple II, and reinvented the personal computer in the 1980s with the Macintosh. Apple is now recommitted to its original mission<to bring the best personal computing products and support to students, educators, designers, scientists, engineers, businesspersons and consumers in over 140 countries around the world.

Not yet, a G3 upgrade card is in development as well as a 3DFX Voodoo card.
An 060 Amiga can get to performance levels of a low end PPC MAC.
AmigaQuake is a good example of this.

AmigaOS is just as fast as a G3/400 MAC but in sheer number crunching
performance a G3/400 would obviously be a lot faster.

Quickpak???. Sheez, your news is as old as the PC architecture :-)
Gateway own Amiga Inc and Phase 5 and Haage and Partner (and a host of
others) are continuing Amiga hardware development.

> > Not to mention the fact that the 060 continues to be developed further,

Embedded systems. Demand outstrips supply.

Regards,

Clockmeister.

>100% of ALL Playstation titles. Now what is the better value?
>

Oh my, you surely are misinformed! The emulator costs $49. That's the price it went for in Macworld.
Well, I don't know about you, but I love being able to play Playstation games on my G3. Games run flawlessly. I only wish I had a PowerBook, so I could play PSX games anywhere, something you CAN'T do with your "genuine" Sony item.

> 2) in order to use the Playstation emulator, you must obtain a
>GENUINE PLAYSTATION OS ROM DUMPED TO DISK. The only legal way you can

>genuine Playstation that is 100% compatible with all games, or to spend
>$180-219 US to run a not-100%-compatible emulator on an iMac?
>

Again, pure bullshit. It doesn't need any sort of ROM. All the emulator is is a 900kb executable. No ROMs, no BIOS, no nothing. The PSX emulators for Windoze require the ROM file, though, so get your facts straight.

> 2a) those of the emulator's users who would forego #2 and actually

>worth it?

>

News today say that Sony has abandoned the idea of suing Connectix,
based on their evaluation of VGS. It seems it's a completely reverse
engineered product, and doesn't use a single copyrighted Sony technology.
And since your point #2 is completely false, there's nothing holding you,
at least from a legal point of view, from running Playstation games on
your Mac G3.

> As usual, TIFKAS is a penny short, a pound foolish, and (like many
>Mac game titles) a year late!
>

No, you're the wrong fool here. Get your facts straight, because you're
now looking just as bad as TIFKAS.

>Will you admitt that you made a boo boo?
^^^^^^

I suggest that you read your missive again - if you'll notice, that
was a categorical denial by Crawford that Intergraph was kicked out.

Unfortunately, it all rests on TechWeb - the organization that
first reported the incident. If you'll notice, they quote Crawford on
why Intergraph was being kicked out. And, if you'll also notice,
TechWeb has yet to retract the story as it was reported.

In any case, you seem to misconstrue the difference between a
categorical denial by a participant and a retraction by the news
source, who seems to be holding to the story. In which case, until
TechWeb retracts the story, you have no case.

So go ahead and ROTFLMAO - because the more you do, the more your
head will be further wedged "up there"......

BTW, it's spelled "admit". Hopefully InCompUSA will pay for your
remedial spelling course......

->(I thought the Robot sucked, but the virtual interface was cool as
->was the rest of the hardware on the show).

I have to admit, when I took my 8 yr old to see it, I figured I'd
sleep through it, but I was pleasantly surprised as well. Special
effects were solid, storyline was fair, the lines were delivered
well (believable) (and did you notice the "romance" between Don
and Judy? It was there, but she handled his advances with aplomb,
i.e., no gratuitous sex scenes) Well done. I also like it when they
give me a "villain" I can hate. ;-)

That VI rocked! (and of course, like so many-that robots voice is
-embedded- in my psyche!) I thought the pace was high too (and
that is always a good thing). My fav scene? From the moment they
burst out of hyperspace (was that well-timed silence or what?)
all the way through the spider battle. ;-)

Early 2000 will see the release of the brand new Amiga II so current upgrades are just there to keep current users up to date. (as much as possible for a small market)

>
> > AmigaOS is just as fast as a G3/400 MAC but in sheer number crunching

>
> That doesn't make sense...

You're right. What I meant is that AmigaOS is much faster then MacOS, partly due to PMT (which the Mac still hasn't got) and a high level of efficiency (not bloated). This means desktop functions are of similar speed on an 060 Amiga and any Mac.
A G3/400 Mac wins out in numbercrunching performance.

Does that make sense?.

>
> > > What do you base this upon? Did not Quickpak go out of business?

Deliver what?. Watch out for a brand new Amiga early next year. Developer systems are nearing completion and should be released shortly.

> > > > Not to mention the fact that the 060 continues to be developed

But demand is demand all the same. The 060 is a good, efficient processor. Hence it's popularity. It's also much easier to implement then the G3 processors.

Regards,

Clockmeister.

I don't remember the actors name that played Smith, but he was a very
easily disliked:). I know he has played a few psyco cops in other
movies and always does a good job. The ships and harware are
outstanding. They kept the special effects to a minimum (as much as
you can with that type of movie). The movie rolled right along, almost
too fast. Maybe a sequel:).

Which was most of the flick:).
They had to go out of the way to add some "hokieness" to it to follow along with the series. Oh, the pain, the pain:).

Like WHAT? Be more specific. Still using Deja-News ehhh...
And WHICH OS for the Atari are you refering to? There are a lot of different
ones in use by many Atarians.

Clockmeister wrote in message <01be3d8a$d87e7560$5a5e0fcb@default>...
>What soundchip does the 1040STfm use?
>More importantly, why is the sound output more like that of a C64 then an
>Amiga?.

Because the STfm is just an ST with a (F)loppy disk drive and a TV (M)odulator built-in. The sound chip used is the same used in your basic MSX-1 computer, the Yamaha YM-2149 which was at one time a pretty popular soundchip, although originally some Texas Instruments chip was to be used.

Like the MSX however, for musical purposes all Atari 16-bit and 32-bit computers have standard MIDI ports, and for a long time, were the only computers to come standard with it, hence the success of Cubase and Notator / Logic.

If you want to hear decent MODs on an Atari, you will either need a soundcard / DAC, or an STE / TT (both 50kHz dual-channel 8-bit stereo DMA) or Falcon (16-bit stereo DMA, 50kHz, 8 channels).

There is more to this. I've always seen the ST as the successor to the C64 in technical aspects, and the Amiga as the successor to the Atari 8-bit computers. This is reflected in many ways, including audio and video. Just look at the 320x200 screen reolution and such. It is even reflected in its founding fathers, the one of the Amiga and the Atari 8-bit being Jay Miner and the one of the C64 and the ST being Jack Tramiel. Indeed, an Atari 8-bit computer has MUCH better and richer (four-channel: compare to Amiga - as opposed to three channel: compare to ST and C64) sound, if you only consider its built-in audio capabilities. The 8-bit 1450 XLD however, had even more interesting features, even on things concerning audio. Info can be found on Atari Historical Society (URL coming up next paragraph)

In fact, there was an official license agreement for Atari to produce Amiga computers as an extension to their Atari 8-bit XL line of computers and they even made a prototype with a XL name but an Amiga architecture. This can be verified on Curt Vendel's excellent Atari Historical Society website, www.atari.nu / www.atari-history.com

The introduction of the STE cought up with the Amiga in both sound and graphics areas, and again there was some sort of mingling of employees. The Lynx, as you might know, was developed by Amiga developers, originally for Epyx, who got into financial problems. This lead to a takeover by Atari Corp. The original developerskit for the Lynx consists of a Commodore Amiga with a Howard board, which is what Atari delivered until withdraw from the hardware-market (they're currently owned for their name by Hasbro, who are republishing classic games like Centipede in 3D for the PC).

Perhaps you should connect a synth to your ST and play an old Sierra
animated adventure...
There were however all sorts of soundcards for the ST, including 12- and
16-bit samplers and also, in stereo.
But what you really should have acquired was a Mega STE or a 1040 STE. You
could then even have upgraded it with standard SIMMS.
>
>I was going to use it as a MOD player but that seems pointless.

Use it as a MIDI system instead. It's not pointless if you use it with
appropriate hardware add-ons, although those may be hard to come by these
days.

YM-2149 comparable to TI something. PCM came with the STE's (50kHz 8-bit
stereo DMA).

Come to think of it.... the STE had line-level RCA / cinch outputs, I was disappointed that Atari reverted to the mini-jack solutions seen on so many PC's. But then, they marketed the machine as a consumer machine and fired the whole German staff who focussed more on the professional market. Then they focussed on the 64-bit Jaguar system including voicemodems, VR-helmets, CD add-ons networking and so on, in 1993. Ofcourse, being great marketeers, they couldn't live up to Sony's marketing standards or Nintendo's cash....

Depends on what field of music production you're in. Dance is probably
better done on the Amiga because of adding computer audio and such. BUT -
just take a look at the charts of the 80's, and guess how many productions
of those were made on an Atari, using Cubase or Notator (later transformed
into Logic)...

Back then, these applications were only available for the Atari and scarcely
for a Mac (American market). Most music productions were done on the Atari,
incl. such names as Michael Jackson and Madonna, to name but two.

Falcon's are rare here, so that really isn't an option. The reason I asked
the original question in the first place is that I aquired this Atari for
free and I needed to put it to work (to justify it sitting around). No
offense, but if I was to purchase a soundcard it would be for the Amiga as
it's my main toy.

> www.atari.nu / www.atari-history.com

From what I have discovered, Atari wanted to use some of the custom chips technology, not use the whole Amiga architecture. In essence though, it amounts pretty much to the same thing.

> The introduction of the STE cought up with the Amiga in both sound and
> graphics areas, and again there was some sort of mingling of employees.

Too little, too late I think. The Amiga already had the video production market by the balls by then.

The

The Lynx was an excellent product and I can't understand how it failed (largely). BTW, I wasn't aware of the Amiga connection :-)

3263. BeOS Vs. TiFKAS' B.S.

Newsgroup: comp.sys.atari.advocacy
Date: 1999-01-17 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <36a2be75.0@nemo.idirect.com>
Source record: 3925

Well, well, well. Just a few weeks ago, in dissing the viability of modern TOS systems like the Hades and the Milan, TiFKAS (The iDiot Forever Known As Sinclap) boasted about how modern operating systems like the BeOS proved how cutting-edge the Macintosh was. Indeed, I was called on the carpet by another Mac user for even daring to suggest from info that I had heard on comp.sys.mac.advocacy that Be was not giving as much support to the Mac as they were to the PC platform as far as keeping up with the up-to-date hardware in both camps.

Well, looky here! Here's some info from Be themselves, on why they are having problems keeping up with the cutting-edge G3 found in such computers like the now-less-but-still-overpriced, now-less-but-still-underpowered iMac, as well as the new 400mHZ G3 server systems. A problem which is being precipated by Apple themselves, who seem afraid of the thought of having an operating system not produced by them show up how bloated and "old-hat" the MacOS has become. OTOH, the PC version of BeOS (which looks pretty nifty and powerful) can run on all the current modern PC architecture out there......

Perhaps TiFKAS can explain to us how "cutting-edge" an alternate Mac operating system can be when it can't even run on anything but year-and-a-half-old hardware (which, using TiFKAS' own yardstick for older but still usable hardware, makes it "junk" and not worthy of your attention). My guess is that instead he'll try a number of his old tactics:

1) deny, deny, deny (just like his hero Bill Clinton - and like Bill, be doing so when obviously caught with his pants down?)

2) try to dodge the subject by mindlessly posting an Apple press release - which, BTW, he has shown on several occasions that he has never read in full.

3) boast about the money he's making, and what a "macho stud" he is (which, BTW, is a sign of a true Internet "kook" with way too much time on his hands).

4) try to lash out against his imaginary friend "Chunks", who doesn't exist and has never existed on this or any forum, or his other favorite target, the equally imaginary "Atari Jihads" who are "out to get him", with his usual extreme bad grammar and unacceptable spelling mistakes (Is "Chunks" anything like Elwood P. Dowd's friend Harvey, the six-foot invisible rabbit?)

5) skip town with his tail between his legs and not show back up
for another three weeks?

If anything, this should make for a very lively debate here - and
which usually ends the same way, with TiFKAS protesting being spoon fed
his much-hated strained spinach by his long-suffering Mummy (Atari and
TOS users, and many intelligent Mac users, indeed, many PC and Amiga
users as well, OTOH, have always eaten their spinach and drunk their
milk to their Mummys' satisfaction, and have grown up to be big and
strong and intelligent)

(BTW, TiFKAS, you may now notice how I now spell the abbreviation
of your given name - it reflects the fact that you're so enamoured of
your beloved iMac that you practically wet your pants when the new
colours were announced. The "i" stands for "ignorance".)

Does the BeOS run on Apple's new "G3" Power Macs, which use the
PowerPC 750 (or "G3") processor?

No, the BeOS is not compatible with Apple's "G3" systems. We have
requested from Apple the detailed technical specifications we would need
to provide support for these systems, and Apple has declined our
requests.

This information, concerning the design of the logicboard (including
information about address spaces, custom logic chips, etc.), is
available only from Apple. It is available only under non-disclosure,
and only to "Mac OS licensees."

The necessary information is much more detailed than the "technical
specs" information Apple puts on their web site. Trust us, we haven't
"missed" something tucked in some corner of their site. Apple does not
make this information public at all anymore, because there are no more
Mac OS licensees.

Without this detailed technical information, it is impossible for us
to support new Power Macintosh hardware from Apple.

Can't you reverse engineer the information you need to run on
Apple's "G3" machines, maybe from LinuxPPC, which runs on such systems?

No. Partly it's because we're nervous about porting to a platform
who's owner doesn't want to share technical information. Sure, we could
figure it out, with help from Linux source, but that's a tricky way to
build a commercial, stable platform, and we'd always be at the mercy of
undocumented, unnanounced changes to the hardware.

Even if we did want to take this approach, this would take a lot of
resources, and we're stretched to the max as it is.

There's also two legal issues, one, would Apple let us do this (who
cares if legally it's OK, they have a lot more lawyers than we do), and
two, could we use the Linux sources and still keep the BeOS proprietary
(which we intend to do, see the FAQ on that).

Does this mean that Be is abandoning the PowerPC/Power Mac platform?

Not at all! Be fully intends to continue supporting existing BeOS
Ready Systems for as long as possible, and we will add support for new
systems where that is technically and economically feasible.

hmmm, even with how well iMac sales did in the beginning, overall sales of computers at Apple were down - let's look at the big picture there. It's all there in the SEC report.

BTW, according to another report, even with 800,000 iMacs sold worldwide, the PC industry in contrast sold 40,000,000 PCs during the same time frame. Certainly puts a dent in your wild claims of "10% marketshare".....

Well I alwas was a profound proponent of Atari and Amiga cooperation, but
nobody seemed to share my passion and vision. I believed that it was a
necessity for both companies to hold their grip on the market, and survive.
The one way they could produce truly AWESOME advances and stand ground
against the other platforms with a larger overall market share.... although
from marketing point of view it would have mattered that much I guess...

>
> *Except in the case of Apple, who are still trailing. PMT Mr Sinclap?...

grin :-) I never even saw Apple as an "enemy" but rather one of the Motorola gang, one of the "A-Team" (Atari/Amiga/Acorn/Apple), and Mr. S.'s attitude and postings in this newsgroups will not affect my opinion in any direction, although it does confirm the feeling you sometimes get in discussions with people who claim to be die-hard fans for the platform. I hope it doesn't count for ALL of it's fans. On the other hand... Apple's been "sleeping with the enemy" lately, hasn't it?

Any comments on this?

You're pathetic.
If you'd do your homework, you'd know for a fact that Atari is now owned by Hasbro, which is hardly out of business. As for the computer side of things.. I think there's more to choose from in the Atari and Amiga clone market than the extensive range of computers that Apple currently has to offer or can supply...

Why are you trolling this newsgroup anyway? What's your interest in this?

>amounts pretty much to the same thing.
Did you visit www.atari.nu? It shows a detailed contract in writing,
mentioning in detail, the WHOLE ARCHITECTURE specification.

Well, all I know is that Amiga Technologies existed before it was taken over
by Commodore and it was after this takeover that contracts between Atari and
Amiga Technologies (or Commodore by his time) were breached. Atari even
supplied a major quantity of technological knowledge and engineering
manpower to Amiga Technologies before the takeover, most of which remained
working at Commodore because of "their man" Jay Miner. Likewise, the
Tramiels took over Atari and brought their share of engineers. So your Amiga
has in fact, to some extend, quite a lot of "Atari blood" so to say ;-)

The reason of the takeover by Commodore is believed to be its vision of a
necessity of a 16-bit and 32-bit computing platform.

>
>Too little, too late I think. The Amiga already had the video production
>market by the balls by then.
The STE was not meant for video production, that would be more the TT or
Falcon (which has a universally programmable DSP) area, although the latter
more excels at audio recording. The STE was just meant for games, but yes,
it was way too little and way to late. I still feel sorry having my STE
traded in for a Falcon though. I should have kept it and simply added a

Falcon. I later acquired an STfm machine but sadly it isn't quite the
same... :-) I miss that 50kHz stereo DMA sound of some dedicated STE
software...

>>
>
>The Lynx was an excellent product and I can't understand how it failed
>(largely). BTW, I wasn't aware of the Amiga connection :-)
I do: it was marketed by the same people who excel in technology, but really
shouldn't become salespeople.... poor marketeers. Both Atari and Commodore
seemed to suffer from this. I always wondered what a merger between Atari
and Commodore would have been. Like: selling games machines under the Atari
label because this is practical because of its name (which would include the
Commodore CD32 and CDTV), and selling computers under the commodore label,
or perhaps an enitrely new brand name).

The Jaguar (64-bit) and the Falcon were also excellent products, as were the
portfolio, the transputer workstation and the TT and Mega STE. The rest of
the 16- and 32-bit systems were arguably "lesser" systems who had their own
succesful niche market , but with good reason. They obviously had their own
appealing qualities that can not just be accounted for by counting die-hard
Atari fans. At least they were highly affordable at launch time.

>> But what you really should have acquired was a Mega STE or a 1040 STE.
>You
>> could then even have upgraded it with standard SIMMS.
>
>My previous comments probably cover this.
Just give it a try once. The sound of the STfm is not great but a Sierra
game that supports a synth on your MIDI-port sounds pretty great - well the
music part at least so long as it has support for your synth (by this time,
the "General MIDI" specification did not exist yet)...
>
>> >I was going to use it as a MOD player but that seems pointless.

MOD is originally a native Amiga format. So I was wondering why you would
use an ST for it while you have an Amiga :-)

>>
>> Use it as a MIDI system instead. It's not pointless if you use it with
>> appropriate hardware add-ons, although those may be hard to come by these
>> days.
>>
>Especially in Australia.

Can't judge about that. I'm sure though someone might have some old version
of Cubase or Notator lying around and surely someone has a synth or module
somewhere? :-)

Perhaps you ARE misinterpreting. How about Atari clones 1.5 years old? You
did mention those once or twice. Looks to me like you're the one who is
"selectively overlooking" which is btw - NOT the same as misinterpreting.
Buy a dictionary.

Yeah, and you're advocating in the wrong newsgroup... this is
comp.sys.ATARI.advocacy
You're not even advocating. You're posting press releases. Hardly anything
intelligent and worthwile discussing in the context of a computing
platform's newsgroup? More for analysis by a linguistic newsgroup that would
also give you a detailed statistical analysis and perhaps even a diagnosis
for your communicative skills.

no misinterpret - you made your point quite clear. And what school
administrators are you quoting? How about some names, dates, situations?

What they want - and what they are actually able to GET - are two
different things. What I've read is that, due to the cutting of
education budgets by governments, that schools just can't afford the
cutting-edge stuff. I know of many organizations that collect old
computers so that they can be used by students rather than showing up
in landfills...
>
>
>> 1) deny, deny, deny (just like his hero Bill Clinton - and like

he denied that his pants were down. If he had only told the truth
when the scandal was first revealed, and apologized for it sincerely,
instead of that self-serving speech he gave, he wouldn't be in the mess
that he's in, and he'd certainly be better remembered in history as a
great legislator.

>> 2) try to dodge the subject by mindlessly posting an Apple press

ahhh, showing your true colours about the contempt you feel about
labourers, which you previously denied you said when it came up the last
time. Just remember that the labour class make up a significant part of
the economy regarding their purchasing power - and they do purchase
computers and peripherals. Which means that they help pay for your
wages, pinhead. Want to try extricating your OTHER foot from your mouth?

BTW, I've been asked to go to an interview tomorrow regarding a job
opportunity that may well mean a promotion and a better wage.....

you certainly have boasted about what a stud you are many times, as
well as your bank account, which any search under DejaNews will
reveal.....

>> 4) try to lash out against his imaginary friend "Chunks", who

>You have way to much time...What happen? Did your employer cut your seasonal
>labor hours?

again, a slam about my being a labourer - shows that you're quite
the elitist - and that I'm clearly getting under your skin.. I happen to
budget my time quite nicely, thank you.

AND, I tend to go and talk under many USENET forums - unlike you,
who seem to just hang around mostly in the Atari forums to slam people
because you're so self-conscious that anyone is actually being
productive with an Atari...still afraid to post to comp.sys.mac.advocacy?

>> (BTW, TiFKAS, you may now notice how I now spell the abbreviation
>> of your given name - it reflects the fact that you're so enamoured of
>> your beloved iMac that you practically wet your pants when the new
>> colours were announced. The "i" stands for "ignorance".)
>>
>I don't own an iMac...

but you certainly like boasting about the iMac, despite its many
flaws....the fact that you keep harping about the new colours is a
legit comment to make on your obsession, as well as your ignorance....

>
>> Does the BeOS run on Apple's new "G3" Power Macs, which use the
>> PowerPC 750 (or "G3") processor?
>
>Unfortunately no..I wish Apple would give Be in what they need to make it so..
>MK Linux does..

now that is at least one of the first honest admissions you've made
in a long time.....

>>
>Still a veep?

still a moron? Since when is it a shame to be the number 2 man,
especially when the #1 man is also doing a good job? The TAF executive
acts as a team, not like a Klingon Battle Cruiser crew.... :)

BTW, the interviewer was impressed by my being a "veep" on my
resume that they were interested enough to consider me for the new
post....

So why do you need to use a PC if your Amiga OS is so great?

8.5 has sold 2 million units and has lived up to the hype..

Oh what denial! Hasbro owns the scraps of Atari has no interest in entering
the computer market. I have notice that Hasbro has indeed reentered the
market with Atari's old game library...

Image FX, Imagine, Lightwave (which can use the Photoshop plugins),
Numerous DTP packages, Navigator is being ported whilst Aweb (with Java
support), IBrowse and Voyager are all good browsers. YAM, NewYork, and
probably the best newsreader on any platform, Thor.
Not to mention Miami, the easiest of all TCP stacks and Amiga has the best
IRC clients available on any platform.

Likewise, the list goes on. Being ignorant of the availability of software
for another platform doesn't give justification for you to judge the
software availability for that platform.

A PC is not an OS. Best of both worlds?.
Is there a reason why I shouldn't use two platforms?.

> 8.5 has sold 2 million units and has lived up to the hype..

Blind faith. 8.5 is just a makeover, the core is still rotten.

Get's the job done, providing it doesn't crash and you don't mind the fact
that co-operative multitasking stinks and MacOS is still rotten at core
level. Productivity is obviously not an issue when you buy an Apple PC.

Regards,

Clockmeister.

interesting - but no dates and situations.

BTW, today's Toronto Sun had an article on the situation on what I
was talking about - "Why Johnny Can't Compute" - which talks about
Computers For Schools and the situations that are requiring why they
are doing what they're doing. The writer admits, the school systems
just don't have the budgets.....

lying to a grand jury about having his pants down is a Federal
offence. Certainly you can at least watch what's going on on TV to know
what's going on with your president, and what the issues are....
>
>The 2000 election will be good for the dems...

They'll do well - after all, Al Gore is too boring to do anything
controversial. OTOH, Calvin Coolidge was considered boring and yet he
turned out to be a good president :)

>> I read all articles I post in full, and I make the appropriate

Nope, I enjoy using my Amiga now, and my PC to a lesser extent. If it
happens it happens, if not who cares. Apple is dead in the water if the new
OS doesn't live up to the hype. (Which it won't judging by Apples track
record)

From todays macintouch.com

Toshiba/Microsoft Saga

Geoffrey D. Bennett
geoffrey@netcraft.com.au
12/Aug/1998

I hope that this web page will prove useful to those people who want to purchase a laptop without Microsoft Windows. The short summary is:

It is near impossible to buy a laptop without Windows
The Microsoft Software License Agreement allows you to return the software if you do not agree to its terms.
It is difficult, but not impossible to get Toshiba (at least in Australia) to send you a cheque in return for the Windows License.

I purchased a Toshiba notebook on February 2nd this year from my local Linux-friendly supplier (Nick Stock at Cybernet Systems). Being the devoted Linux user I am, I didn't want to pay for a copy of Microsoft Windows if I wasn't going to use it. Unfortunately, Nick informed me that it was impossible to purchase a Toshiba (or practically any brand of notebook) without Windows coming along for the ride.

When I received the computer, I noted that the ``End User License Agreement for Microsoft Software'' stated that I did not have to accept the agreeement, and if I didn't agree to its terms, I could contact the manufacturer for instructions on returning the software for a refund. That seemed like just what I wanted, so I contacted Toshiba in Adelaide and spoke with Kon Karanastasis.

Kon had apparently never heard of anyone wanting to return just the software for a refund, so it took a while to explain what I wanted. "I want to give you back the Microsoft software and receive a cheque in return", "We don't do that", "But the license agreement that Toshiba supplied with my computer says you will". Kon asked that I send him a letter explaining what I wanted, along with a copy of the invoice for the notebook and he'd find out what could be done.

Here's the letter:

NetCraft Australia
PO Box 390 Blackwood 5051
Phone: 08 8370 3650
Fax: 08 8278 8325

2 February 1998

Mr. Kon Karanastasis
Toshiba
5 Hurtle Square
Adelaide SA 5000

Dear Kon,

With reference to my phone call to you today, I have purchased a Toshiba Satellite Pro laptop computer which included a copy of Microsoft Windows 95 pre-installed. The ``End-User License Agreement For Microsoft Software'' included with the computer states in part:

If you do not agree to the terms of this EULA, PC Manufacturer and Microsoft are unwilling to license the SOFTWARE PRODUCT to you. In such event, you may not use or copy the SOFTWARE PRODUCT, and you should promptly contact PC Manufacturer for instructions on return of the unused products(s) for a refund.

I do not agree to the terms of the End-User License Agreement for the Windows 95 software, and would like to return the software for a refund. Please supply me with instructions on how to return the software.

As you requested, I have enclosed a copy of the invoice for the Toshiba laptop computer.

Regards,

(signed)

Geoffrey D. Bennett
Computer Systems Manager
NetCraft Australia

Kon got back to me and the word from Sydney was that Toshiba would be happy for me to return my notebook and receive a full refund, but they were not willing to give me a refund on just the Microsoft Software. I explained that this was unacceptable; the license agreement for the Software specifically said that I could return just the Software. Too bad apparently; Toshiba have a contractual agreement with Microsoft where they can't unbundle the software from the hardware, therefore they wouldn't give me a refund.

I obviously wasn't happy with this, so Kon said that the person to talk to was Laurence White from Product Planning in Toshiba. I sent him an email explaining the situation:

Date: Tue, 3 Mar 1998 16:25:06 +1030 (CST)
From: "Geoffrey D. Bennett" <g@netcraft.com.au>
To: laurence_white@isd.toshiba.com.au
Subject: Return of unused software

Dear Laurence,

Kon Karanastasis from Toshiba in Adelaide said that I should contact
you regarding the return of the unused Microsoft software that came
with my Toshiba laptop.

On the 2nd of February this year, I purchased a Toshiba Satellite Pro
laptop computer which included a copy of Microsoft Windows 95
pre-installed. The ``End-User License Agreement For Microsoft
Software'' that was included with my computer states in part:

If you do not agree to the terms of this EULA, PC Manufacturer and
Microsoft are unwilling to license the SOFTWARE PRODUCT to you. In
such event, you may not use or copy the SOFTWARE PRODUCT, and you
should promptly contact PC Manufacturer for instructions on return
of the unused products(s) for a refund.

I did not agree to the terms of the End-User License Agreement for the
Microsoft software, so I refrained from using the software, and I
completely removed it without creating any backup.

I would now like to return the unused software product for a refund.
Could you please supply me with instructions on how to return the
software and obtain a refund.

Regards,
--
Geoffrey D. Bennett (geoffrey@netcraft.com.au)
Computer Systems Manager, NetCraft Australia
http://www.netcraft.com.au/geoffrey/
Red Hat Linux Resellers: http://www.netcraft.com.au/redhat/

Laurence told me essentially the same thing that Kon did. I can return the
notebook, but I can't return just the Software:

Date: Thu, 05 Mar 98 10:08:40
From: "laurence white" <laurence_white@isd.toshiba.com.au>
To: "Geoffrey D. Bennett" <g@netcraft.com.au>
Subject: Re: Return of unused software

Hello Geoffrey,

I am the Toshiba Product Manager and am responsible for all
notebooks.

The EULA you have received is a generic Microsoft document supplied by all
manufacturers as proof of the purchase of your operating system.

As you can see in the wording of the text you need to contact a
vendor for
instructions and Toshiba is unwilling to refund the cost of the
operating
system.

Toshiba is required by Microsoft contract to provide and purchase a valid
operating system. Toshiba cannot get a refund from Microsoft.

I hope you can understand our position. Toshiba must pay Microsoft
at point
of manufacture and cannot get a refund from Microsoft, so we can't
refund
you.

If we gave you a refund on the operating system component then
Toshiba
cannot claim this on Microsoft.

I hope this explains our position with Microsoft Software.

Regards
Laurie White
Toshiba Australia

(my original message was included here)

If at first you don't succeed... so I asked again, explaining why his reasons for refusing a refund were not valid:

Date: Thu, 19 Mar 1998 02:26:22 +1030 (CST)
From: "Geoffrey D. Bennett" <g@netcraft.com.au>
To: laurence_white@isd.toshiba.com.au (laurence white)
Subject: Re: Return of unused software

Hi Laurie,

Thank you for your reply to my message regarding the return of unused Microsoft software. Although I understand Toshiba's position, it is not acceptable for reasons I give below, and therefore, I would like to request for the second time you to send me instructions on how to return the unused Microsoft software to Toshiba and obtain a refund for that software.

You wrote:

> Hello Geoffrey, > > I am the Toshiba Product Manager and am responsible for all notebooks. > > The EULA you have received is a generic Microsoft document supplied by all > manufacturers as proof of the purchase of your operating system.

I'm not sure how this is relevant? The EULA certainly is my proof of purchase, but it is a lot more than that. The EULA states the terms under which the software is to be licensed to me under. I have rejected those terms, and according to the agreement I may not use or copy the software and I should return it for a refund.

The EULA is the document that specifically says that PC Manufacturer (Toshiba in this case) and Microsoft are unwilling to license the software to me, and I should contact Toshiba for instructions on returning the software for a refund.

> As you can see in the wording of the text you need to contact a vendor for > instructions and Toshiba is unwilling to refund the cost of the

operating > system.

Toshiba might be unwilling this month to refund the cost of the
operating system to me, but the EULA which was sent to me last month
by Toshiba with the computer when I purchased it does not include a
provision for you to reject my claim for a refund.

If Toshiba were not willing to refund the cost of unwanted software to
me when I purchased the product, Toshiba should not have supplied me
with a license agreement that states that I can return the software
for a refund.

> Toshiba is required by Microsoft contract to provide and purchase a
valid
> operating system. Toshiba cannot get a refund from Microsoft.

The agreement between Toshiba and Microsoft is irrelevant to me.

The agreement between myself, Toshiba, and Microsoft says that I can
return the product for a refund. Whether or not Toshiba can then
receive a refund from Microsoft is really none of my business.

> I hope you can understand our position. Toshiba must pay Microsoft at
point > of manufacture and cannot get a refund from Microsoft, so we can't
refund > you. > > If we gave you a refund on the operating system
component then Toshiba > cannot claim this on Microsoft. > > I hope this
explains our position with Microsoft Software.

I do understand your position, but if Toshiba enter into an agreement
with Microsoft where Toshiba is required to purchase Microsoft
software for each notebook, then Toshiba should be willing to wear the
cost of that software if I do not want to purchase that software from
you.

Surely the discounts obtained by purchasing Microsoft software with
every notebook manufactured far outweigh the cost associated with me
not wanting to purchase the Microsoft software from Toshiba? If they
don't, perhaps Toshiba should review their agreement with Microsoft.

I look forward to your reply.

Regards,
Geoffrey.

He obviously didn't like my arguments:

Date: Thu, 19 Mar 98 09:38:15
From: "laurence white" <laurence_white@isd.toshiba.com.au>
To: "Geoffrey D. Bennett" <g@netcraft.com.au>
Subject: Re[2]: Return of unused software

Geoffrey,

Toshiba is happy for you to return the complete computer system for a refund to the place of purchase. We are not willing to sell just the computer system to you.

If you have any further questions regarding this matter you will need
to talk with our legal department.

Regards
Laurie White

(my first reply was included here)

I called the ACCC (Australian Competition and Consumer Commission) who said that selling one product bundled with another as Toshiba are doing is an okay thing to do, and then I called Consumer Affairs who suggested I see a lawyer. I ended up going to see someone from the Legal Services Commission who said that I could take my case to the small claims court and I'd probably win, but if I didn't then I'd be up for their expenses (plane trip from Sydney plus hotel accomodation). I definately didn't want to take that risk, so I decided to give in.

By this time, the model of notebook I had purchased was discontinued (it had been about two months since I purchased it) and the next model up was $700 cheaper than what I had paid for mine. Since Toshiba were offering me the chance to return the entire computer, this was obviously a good deal. They were effectively offering me $700 and a notebook upgrade :-). I didn't really want to pursue this option, since I would still be paying for a copy of Microsoft Windows that I didn't want (it's the principle of the thing!), but I didn't see any other option.

So I contacted Nick, who was quite happy to take the computer back from me provided that his supplier would take it back from him. Unfortunately, his supplier didn't like this idea and were quite ticked off that Toshiba would say to me that I could return a pre-loved, two-month old, and discontinued computer at their expense. They wanted to know who at Toshiba told me this.

I then get an email (quite unexpectedly) from Kon Karanastasis, who wrote:

Date: Thu, 02 Apr 98 13:46:11
From: "kon karanastasis" <kon_karanastasis@isd.toshiba.com.au>
To: geoffrey@netcraft.com.au
Subject: Return of Unused Software

Dear Geoffrey

In respect to your formal request for a refund for unused software on your

Toshiba Laptop Computer the matter is currently being assessed by our
General Affairs Division.

Before they reach a final decision they have asked me the following
questions
in respect to your purchase ;

1. Mr Bennett states that he purchased the computer on 2nd
February 1998.

From whom did Mr Bennett purchase the computer?

2. Did he rely on a brochure in making his decision?

3. At the time of purchase did he notify the vendor that he did
not want the standard MS operating system?

4. Did Mr Bennett read the End User License Agreement prior to
turning on the Computer for the first time?

5. Mr Bennett states that he "refrained from using the
software, and .... completely removed it without creating
any backup". How was this accomplished? When was the
Operating System deleted?

6. Has the computer been used between the dates of 2nd February
1998 and 3rd March 1998? If in the affirmative, utilising
what operating system?

If you could please provide answers to these questions, I will ensure a
speedy
resolution
of this issue.

Regards
Kon Karanastasis
Toshiba ISD

Email Add : Kon_Karanastasis@isd.toshiba.com.au
Phone : 08 8223 2878
Fax : 08 8232 5022

I thought that the above message was a bit strange, since I hadn't talked to
Kon for quite a while now, and I wasn't asking them consider a refund for the
unused software anymore. I wrote the following email back:

Date: Thu, 2 Apr 1998 15:42:33 +0930 (CST)
From: "Geoffrey D. Bennett" <g@netcraft.com.au>
To: kon_karanastasis@isd.toshiba.com.au (kon karanastasis)
Subject: Re: Return of Unused Software

Dear Kon,

You wrote:

> Dear Geoffrey
>
> In respect to your formal request for a refund for unused software on
your
> Toshiba Laptop Computer the matter is currently being assessed by our
> General Affairs Division.

I'm a bit confused here, because my refund for unused software has
been assessed and denied three times already, each time with an offer
for me to return the entire computer, and the last time also telling
me that I'd need to contact Toshiba's Legal Department if I wanted to
take the issue of returning just the software any further. After the
three refusals, I decided to take up the multiple offers of returning
the computer, so I contacted my supplier to arrange doing so.

Are Toshiba now reconsidering the refund for the unused software? If
so, that is fine, but if it is refused (for the fourth time), I will
be again wanting to take you up on your offer for me to return the
entire computer.

> Before they reach a final decision they have asked me the following
questions
> in respect to your purchase ;
>
> 1. Mr Bennett states that he purchased the computer on 2nd
> February 1998.
>
> From whom did Mr Bennett purchase the computer?

I purchased the computer from Nicholas Stock at Cybernet Systems
(017 864 264). I sent you a copy of the invoice on February 2nd.

> 2. Did he rely on a brochure in making his decision?

No, I didn't rely on a brochure in making my decision. I read many
brochures, viewed many web pages, and talked to many people when
deciding which notebook to purchase.

> 3. At the time of purchase did he notify the vendor that he did
> not want the standard MS operating system?

My vendor was aware before I purchased the computer that I did not
want the standard MS operating system. My vendor had already informed
me that it was not possible to have Windows removed from the computer
before purchasing it.

> 4. Did Mr Bennett read the End User License Agreement prior to
> turning on the Computer for the first time?

I did. The license agrement said that if I did not agree to its
terms, Toshiba and Microsoft were unwilling to license the software to
me, and I could return the software for a refund. Therefore, I did
not use the software, and I contacted Kon to arrange a refund.

> 5. Mr Bennett states that he "refrained from using the
> software, and .... completely removed it without creating
> any backup". How was this accomplished? When was the
> Operating System deleted?

I removed the operating system by connecting the floppy disk drive,
inserting a Red Hat Linux boot floppy, turning on the computer,
deleting all partitions on the hard disk, and installing Linux. I did
this on the same day I received the computer.

> 6. Has the computer been used between the dates of 2nd February > 1998
and 3rd March 1998? If in the affirmative, utilising > what operating
system?

Yes, the computer has been used the entire time I have had it. The
operating system used has been the Red Hat Linux operating system.

> If you could please provide answers to these questions, I will ensure a
speedy > resolution > of this issue.

Thank you,

The next day I received an email back from Kon:

Date: Fri, 03 Apr 98 13:14:32
From: "kon karanastasis" <kon_karanastasis@isd.toshiba.com.au>
To: "Geoffrey D. Bennett" <g@netcraft.com.au>
Subject: RE: Return of Unused Software

Geoffrey

Toshiba's General Affairs Division have assessed your claim for a refund of
the unused Microsoft Software.

Toshiba is prepared to offer you $110.00 (AUS) as a refund for not using
the bundled software.

Please confirm your acceptance (or otherwise) of this offer and we will
implement the
appropriate actions to settle this matter.

Regards

Kon Karanastasis

(the message he replied to was included here)

Since this was exactly what I was wanting, I wrote back:

Date: Fri, 3 Apr 1998 16:21:43 +0930 (CST)
From: "Geoffrey D. Bennett" <g@netcraft.com.au>

To: kon_karanastasis@isd.toshiba.com.au (kon karanastasis)
Subject: Re: Return of Unused Software

Hi Kon,

That sounds good. Let me know what the next step is.

Regards,
--
Geoffrey D. Bennett (geoffrey@netcraft.com.au)
Computer Systems Manager, NetCraft Australia
http://www.netcraft.com.au/geoffrey/
Red Hat Linux Resellers: http://www.netcraft.com.au/redhat/

Time passed, and I called Kon to find out what was happening to my cheque. He explained that in big companies, weird things like giving money to customers for return of Microsoft software can take a while to happen. A little later I received an email from him:

Date: Thu, 07 May 98 14:51:43 +1000
From: "KON KARANASTASIS"<kon_karanastasis@tap.toshiba.com.au>
To: <geoffrey@netcraft.com.au>
Subject: Refund for Unused Software

Geoffrey

I've followed up the progress of your refund cheque.

I still can't give you a definite date, however, I think I've managed to put some higher priority on your claim.

Hopefully it should all be resolved within a fortnight.

Regards

Kon Karanastasis

Email : Kon_Karanastasis@tap.toshiba.com.au

And then the email I was waiting for:

Date: Thu, 21 May 98 10:46:44 +1000
From: "KON KARANASTASIS"<kon_karanastasis@tap.toshiba.com.au>
To: <geoffrey@netcraft.com.au>
Subject: Refund Cheque

Hi Geoffrey

Your refund cheque has arrived in Adelaide.

If you would like to return all documentation/software relating to MS Windows to
Our office at 5 Hurtle Square you can pick up your cheque.

Regards

Kon Karanastasis

I couldn't pick up the cheque immediately because I had just left for Linux Expo, but when I got back I wasn't in any particular hurry to get the cheque because it was the principle of the thing, not the money. After some hassling from a couple of LinuxSA members at the July meeting, I finally went to Toshiba on the 10th of August to pick up my cheque.

Lo and behold, I now have a cheque for $110 from Toshiba in return for an unused license for Microsoft Windows!

Many thanks to:

Paul Ashton (of Samba fame). Paul was the one who told me in January that when I purchase a laptop I should read the Microsoft Licence Agreement, and take note of the bit about a refund. Kon Karanastasis at Toshiba for being patient with such a strange request. Nick Stock at Cybernet Systems for being an all-round good guy.

No thanks to:

Laurence White at Toshiba for three times denying my request for Toshiba to honour the license agreement they included with my computer.

If there's anyone else wanting to do a similar thing, I think that the important things are:

Check the license agreement. Look for something like ``If you do not agree to the terms of this EULA, PC Manufacturer and Microsoft are unwilling to license the SOFTWARE PRODUCT to you. In such event, you may not use or copy the SOFTWARE PRODUCT, and you should promptly contact PC Manufacturer for instructions on return of the unused products(s) for a refund.''

As the first thing you do with the computer after you purchase it, boot from a floppy and delete the Windows partition. If you boot
Windows even once, you will probably be considered to have accepted the agreement. To prevent any arguments later, it would be best
to delete the partition while you are still in the store, with the salesperson watching.

Contact your manufacturer immediately, and say that you do not agree to the terms of the EULA and would like instructions on return of
the unused Microsoft Software for a refund.

Well, it all just cackles out the monitor. Back then only the Amiga had sound
and the 1000 only had 256k to do it with. Yuck. What is amazing is what the
Union got for sound out of a normal ST with the UNION DEMO. One of my old
favorites.

You have the bottom line Atari so only so much is to be expected. I am using
mine ATM Circa 1985 TOS 1.0 on the internet to write this to you. In the end
I can't say I have been to dissapointed with mine after 14 years:-).

You have not used 8.5 have you? And you have a short selective memory..The Amiga crashed constantly...It was those dammmmm guru errors.. I thought it was helarious at the time is when the local cable company used the Amiga for the public info bulletin board...Would always crash on the weekends with that dammm stupid guru error that needed to be reset but only on the following Mondays when the office opened..

A cheap adaptor sorted that problem. The signals have allways been there on
the serial port.

Not in this country... 256k Amigas where never released with the early
A1000's all having the 256K RAM expansion included as standard. The US
Amigas with 256K did manage PMT though and that's one hell of an
avhievement considering what it took for the PC to get the same thing.

What is amazing is what the
> Union got for sound out of a normal ST with the UNION DEMO. One of my old
> favorites.

It's amazing what the Spectrum crowd got out of their machines, so it's no
surprise.

Timing on PC's is horrible, which is an important part of MIDI sequencing I
believe.

One hit wonder... NOT!. They are huge in this country and are actually very
good live. (I'm not a fan though)

Co-operative multitasking is something a C64 does, not a modern computer.

Nice try indeed...

If you read carefully, Microsoft actually plays no part in this. It's just Toshiba's willingness (or lack of) to refund money based on the MS license agreement.

Toshiba is bound to a licensing agreement with MS, that's for certain however...
If that copy of Windows is returned to Toshiba (it had to be sealed and complete with documentation) it would surely have been bundled with another computer, and not returned to MS.

Don't get me wrong here, I dislike MS's business practices intensely but this example is not a good one as MS plays no real part in it.

Just my 2c

That's bollocks, and you are hardly the person to make such statements,
especially not when you take your comment above in account.
MacOS is a fourth-rate OS.

>> A PC is not an OS. Best of both worlds?.
>> Is there a reason why I shouldn't use two platforms?.

>Which means the Amiga can't get the job done!

I think that's what he's implying. For example, why would he use Microsoft
Internet News when he has got an Amiga, which in fact has got the world's best
news reader, Thor (Which I'm currently using).

Rock Solid Midi Timing!

*Atari 1040 STe with 4 megs of RAM (lots for this machine)
*SM125 - Monochrome Monitor
*SC-1224 - Color Monitor
*SMPTE Track Gold with external SMPTE Box
*External Maxtor scsi 245 meg HDin FaST metal case
(this cost me $700 new - oh how times change)
the HD is full of stuff too... find what ya like delete what ya don't need. I've not used this computer for a while but I just loaded it up and it werking PERFECT.

you can have a bunch of games too I won't need em... (lemmings 2, bloodwynch, dungeon master etc)
I'll even toss in a Star NX 1240 24 pin Printer with extra ribbon.

All the hardware is in VERY Excellent condition....

$400 get the lot
you pay shipping

may consider a trade for some external signal processing... I could really use a good compressor

Hi Brian,

Expose is a hardware video capture device. Not available anymore, and very few NTSC units were produced. It works hand in hand with Apex Media. There is another video editing application in the works called Mountain. Very nice for building animations and video clips. Looks a lot like Adobe Premeier's interface, but much faster;). (Sorry Sinplop, I couldn't resist:).

> I did look at Papyrus that on my falcon , but the wp needs to run STFM 1MEG.

True. I didn't think of that (having 4 megs myself). I remember that
Atari Works also needs at least 1 meg. Works also has a bug that
requires 4 megs to be able to print with an inkjet (HP 500), otherwise
it only prints a black page...

Anyway, both programs are a nuisance if you don't have a hard disk! Can
be run from floppy, but require constant disk swap.

> I am thinking maybe I should be getting my falcon to work?

Yes. Or get an STE (Mega preferably, with hard disk). Memory expansion
is easier.

MiNT once stood for "MiNT is Not TOS," and then, when Eric Smith went to
work for Atari, "MiNT is Now TOS."

I haven't run MiNT since about 1994; I've got an Atari ST boxed that it
should still be runnable on.

Essentially, MiNT was a "POSIX+TOS" for the Atari ST. Real, preemptive
multitasking, albeit without memory protection.

3317. Sony Sues Connectix, TiFKAS eats own foot!

Newsgroup: comp.sys.atari.advocacy
Date: 1999-01-30 00:00:00 UTC
From: dreibel@idirect.com
Message-ID: <36b3073e.0@nemo.idirect.com>
Source record: 3780

way back, oh about two-three weeks ago, TiFKAS (The iDiot Forever Known As Sinclap) was triumphantly crowing about a new program from Connectix that would increase the number of games available for the now-less-but-still-overpriced, now-less-but-still-underpowered iMac. Indeed, championed by Steve Jobs at MacWorld, the new program was designed to add more games by emulating a Sony Playstation, thereby allowing access to, theoretically, 500 Playstation titles on CD-ROM.

However, there were immediately rumblings that Sony, and their team of notably humourless patent attorneys, were not happy about Connectix' apparent violation of their game system, and were rumoured to be preparing a lawsuit. And when I reported that here, TiFKAS immediately responded with his usual denials and a prediction (note that he also aimed it at his imaginary friend "Chunks", who has never existed) :

"You are on a roll Chunks...Sony did not file a lawsuit....Look for a license deal soon..."

well, Think Again, TiFKAS - here's the news from January 28th - Sony HAS filed a lawsuit against Connectix, and has denied any licensing deal from either them or Apple.

First here's the link - to show you that the story IS going on:

http://www.sfgate.com/cgi-bin/article.cgi?file=/chronicle/archive/1999/01/28/BU14618.DTL

and now here's the meat of the story - pay close attention, TiFKAS:

<start quote>

Sony Sues Over Game Software

Jon Swartz, Chronicle Staff Writer Thursday, January 28, 1999

Sony Computer Entertainment Inc. yesterday filed suit claiming that a new software program that runs Sony PlayStation games on late-model Apple Macintosh computers infringes on its copyrights and intellectual property.

The lawsuit, filed in federal court in San Francisco against San Mateo- based Connectix Corp., seeks a temporary injunction against sales of Connectix's Virtual Game Station. The $39 program was introduced with much hoopla at Apple's Macworld Expo trade show in San Francisco earlier this month.

``We don't believe any software publisher or developer would be happy about the (Connectix product),'' a Sony spokeswoman said. ``It does not accurately emulate the PlayStation gaming experience ... and is not fully compatible with all PlayStation game titles.''

In its complaint, Sony claims that Connectix's product ``circumvents'' the PlayStation's anti-piracy policy that is designed to ``inhibit the illegal sale and distribution of counterfeit software.''

The Foster City-based Sony division added that it has not announced any partnership agreements with Connectix or Apple, which is not named in the suit.

Connectix had no comment.

According to Connectix, the Virtual Game Station will only play about 80 out of the 500 PlayStation titles available, but the ones it will play include the popular Madden NFL 97, Crash Bandicoot and Tomb Raider.

The Virtual Game Station is scheduled to ship within a few weeks.

At the Macworld show, Connectix executives admitted the software program has some technical limitations -- some of the games occasionally skip video frames -- but only hard-core gamers will notice.

The software, which was expected to boost Apple Computer's standing in the computer gaming market, requires an iMac or Power Macintosh G3. It will not run on older Macs or ones with a G3 upgrade card.

An estimated 17 million PlayStations have been sold in North America, and 50 million worldwide.

<end quote>

Let's hope you can now wipe up the remnants of your strained spinach off your bib, TiFKAS - it only shows that you not only make up "facts" about Atari computers and their users, but you're now making up "facts" about the Apple world in order to bolster your undeniably rotten reputation. Let's see you try to wiggle out of this one.....

Actually, Peter was correct at the time of his post. Immediately after the Connectix Macworld announcement, Sony had not comment. They then indicated that then might sue Connectix but later announced that they saw no reason to do so. Finally, they announced that they are, in fact, sueing Connectix.

In their latest press release, Sony says that they are not concerned that their IP was used to develop the emulator (their original concern) but they are concerned that the emulator "circumvents the PlayStation's anti-piracy protection technology".

Figures, I have a copy of Apex Media that came with my computer. There was only one disk with it, and the other is missing. I will have to keep my eyes open for these things.

Sheesh...I come back after a couple of weeks hiatus due to being preocupied in
the field to just this...Maybe I should set up a website dedicated to the
sinclap pad of picture scrap book to bring in more discussion here.

Three weeks after MacWorld...Sure took their time.. Sony's argument is based
upon software piracy issue that the emulator may pose. On the same day,
Connectix announced version 1.1... Also will fight Sony's lawsuit...

again - Crawford expressed a categorical denial. The issue deals with TechWeb, which as of yet has still to withdraw the story - and upon whom rests the proof of the pudding. Until such, you have no case.

BTW, it's spelled "misinformed". I may be "just a veep", but I can spell....

And talk about jumping the gun.....

>>>At the time they did not..
>>
>> but they eventually did. And they didn't do a license deal...
>
>Fell through. I bet will settle out of court..

again, Sony DENIED THAT THERE WAS ANY DEAL. IT IS IN BLACK AND WHITE. Talk about speculation....

Not enough sales. Atari was sold to JTS which just recently sold the name
to Hasbro. If you had purchased an ST in 1985 you could at least be on
the internet with an Atari product:-). Yes, jaguar was last games machine
made. It was introduced early and sold to little to late. Very unfortuneate.

Many great Atari ST/TT/Falcons were made until 1995-6? Today these TOS
(The Operating System) computers are still being made in more powerful
configurations. These manufacturers are based and Europe. Hades/Medusa are
being made by a company I cannot remember. And the Milan is the other machine.

While many developers have had years and years and years to leave Atari, there
are still quite a few new products being developed. These powerful applications
should easily keep Atari USers going into the millenium.

As for users, the same is true. While more users have left than stayed, the
surpluss of machines creates a bargain for atari enthusiast who can get alot
of power for very little investment. This to me is the true appeal of the
ST. There are not many 14year old computers that can view, avis, jpegs, mpegs
and ahve a graphical webbrowser.

Well, how is that for a bit of trivia.
I would give a list of websites for real background, but I don't have them
handy.

Brian.

What the hell kind of name is "Peter Sinclair Day" any way. It sounds like the
name off of some sort of feminine napkin package.

Mike

As I watched the new iMac commercial, I couldn't help but think that if the
Atari CEO's had a little more forsight, those could have been dancing Falcon
PPC's on the screen.......

Mike

How would you know?

What kind of name is Mike Sh_t? Used toilet paper? When your mother gave a
name to you is it based upon when she wore army boots to kick the sh_t out of
you? Would explain the last name..

By the way...maybe in noncommunique for the week. Stop by building 4 and say
hi..

----------Find Anything On Anyone ----------

_____

http://www.producthouse.com/netspy _____

Now anyone can become an online sleuth. NetSpy shows how to get access to files and data available for years to credit firms, lawyers, research companies, government agencies, and "snooping" firms. Special "how-to research and investigate" sections are complemented by a guide to special databases and complete coverage of all the major on-line services.

Netspy contains almost everything you need to know to find out just about anything about anyone by using freely available information sources on the Internet. It also contains good basic information on the role of the Net in corporate espionage and explanations of of secure financial transactions online.

Even if you find snooping about other people distasteful, you should get this book to find out what others can find out about you--and how you can cover your digital tracks on the ever-widening silicon beaches surrounding the continents of our existence. Very Highly Recommended

NetSpy shows how to get access to files and data available for years to credit firms, lawyers, research companies, government agencies, and "snooping" firms. read em' and weep, weinerhead....anything you can do we can do
better...BTW, Papyrus 7 has now come out, and will blow your socks off
WITHOUT the bloat of programs like Quark....

Oh yes, '060 version of Milan is to be made available next month,
and MagiC for Milan is coming soon. And all with true pre-emptive
multitasking, which Apple's OS still hasn't accomplished after all
these years....

BTW, we hope the shock treatments you're currently receiving at
Bellevue will soon rid you of the delusions you've been having about
imaginary "Jihads" who are "out to get you", as well as your imaginary
friend "Chunks". Of course, the orderlies will have to make sure you're
completely cured before they allow you to publish your drivel on the
internet again .

Dear Madam, Dear sir,

We are proud to announce you the CENTurbo II B will
be ready to be sold the sixth week (February, 8-12)

Here are the new features:
- New 4 layers optimized PCB with EMI protection.
- New faster EDO BURST Fast-Ram controller from CENTEK:
- 16, 32, 64 or 128 MB with ONE 60 ns EDO 32-Bit SIMM.
- BURST READ with 5,2,2,2 cycles (6,2,2,2 on CT2 A).
- WRITE with 4 cycles (6 on CT2 A).
- Connection between the CT2 and the F030 motherboard by a ribbon cable:
the CT2B can be removed and changed without solders.
- New faster software (English & German) with new features into the
Flash.
- New installation documentation (English).
- New software in the package (English).
- SERIAL port & FPU problems (certain CT2 A) are fixed.
(the fix is available for CT2 A).

All the informations are NOW AVAILABLE on our
WEB site: www.centek.fr.

Have a look on our incredible performance tests with:

PAPYRUS 7
PHOTOLINE 2.24
POV 3 (vase script)
SANDRINE 4.0

GCC 2.7.2
PURE C
DEVPAC 3.10

CUBASE 2.06
V-TRAX 1.0
FIVE TO FIVE 2.13

CAB 2.7
ST ZIP 2.6

Please, see our distributor list to know your local distributor.
If you have no distributor, you can buy at Centek with the
following prices:

- CT2 B (no RAM) 289 euros (Inc. French VAT at 20.6 %)
- 16 MB EDO SIMM 45 euros
- 32 MB EDO SIMM 83 euros
- 64 MB EDO SIMM contact us
- FPU 68882-33 38 euros
- Installation 45 euros (send your motherboard alone + IDE cable)
- Transport contact us

The last news about the PHENIX 040/060

At the end of December, at the very time when the E15 version of the
PHENIX motherboard was ready to be produced for the developers, CENTEK
decided to bring some important changes about the hardware architecture
of this motherboard.

Here is the list of the major changes introducing the R1 (Rev.1) version
of the PHENIX 040/060:

- The DSP56301 is now connected on the PCI bus.
- A card with 3 other DSP could be plugged into a PCI slot, not into a
dedicated slot.
- The ULTRA-SCSI and USB (2 ports) controllers have been replaced. The
new
ones are connected on the PCI bus.
- Two IDE (ATA-4) connectors are now officially provided thanks to a new
component on the PCI bus. Four peripherals are so possible.
- The MIDI, SERIAL & // ports are suppressed. They are possible with
some USB interfaces, opening the way of the future.
- The QUICC chip is suppressed.
- The EDO RAM is replaced by the SDRAM; it is 2 times cheaper and 2
times
faster (with the 060).

Why these modifications ?

The first objective was to reduce the production cost: the suppression of the QUICC and the transfert of some functionalities on the PCI bus (to reduce the programmable logic cost) follows this objective. The reduction of the cost continues actually to equilibrate the cost of the performances increase.

The second objective was to take in count the remarks of some developers (like Soundpool) in the domain of the DSPs. They was wishing to have faster transferts between the DSPs. With the DSP on the PCI bus, the hardware architecture is optimum.

At CENTEK, we were wishing to reduce as much as possible the necessity of the CPU use to transfert the DATA. For that reason, the USCSI and USB are too on the PCI bus.

The performances ?

Imagine the heavy task that reads a movie from a DVD disk. The hard disd drive (HDD) (Ultra-SCSI or Ultra-IDE) transferts the AUDIO and VIDEO DATA (MPEG2) to the controler (USCSI or IDE) that transferts on the PCI bus with BURST at 132 MBytes/s to one DSP56301 to uncompress (real time) the AUDIO and one (or more) other DSP to uncompress the VIDEO.

Each DSP sends the results to the final destinataries:
- the AUDIO to the 20-Bit CODEC (on motherboard) by the DSP-CODEC serial link.
- the VIDEO to the GRAPHIC card by the PCI bus at 132 MBytes/s (BURST).

Conclusion: no important CPU intervention which continues to run into the system SDRAM on the other side of the PCI-040 BUS bridge ! This is the undebatable superiority of the PCI architectured computers, not like the simple 'PCI as peripheral' architecture !

Have a look on our functional block diagram.

The final objective was to draw nearer to this total PCI architecture faster than it was previously planned to easely introduce the new future computers like the PHENIX 2 (code name). The PHENIX is now comparable with the architecture of the last generation of PC.

The choice of the new PCI components was the principal reason of a new delay to terminate the motherboard. We now terminate the PCB routing...

The T1 at the Hilton Garden INN is awesome...Does any TOS notebooks have
ethernet or will soon?

Not for long. Will be an avalanche of USB products in the comming days,
weeks and months. These products will include HD's, scanners, flightsticks,
drawing tablets, printers and so on...Just plug in and don't worry about it.
When will TOS boxes migrate to USB, FireWire and ATI Rage 128?

Apple has released several preemptive multitasking operating systems
throughout the years. The first was used in the Lisa, then A/UX, then MkLinux
and finally Mac OS X Server.

Actually, SCSI is quite old. Modern SCSI systems are still quite fast but you can only have 7 devices per controller, it requires termination, it's not hot pluggable, you have to set device IDs, it doesn't allow branching, the connector is quite large and a computer is required for data transfer.

Well, maybe I should do some reading before jumping in, but exactly how fast
of data transfer can one expect with a USB device? 20mb/sec? 10mb/sec?
2mb/sec?

Seven devices per controller is more than most need, and considering the data
integrity that SCSI provides, arbitration features (can USB handle
machine/hardware arbitration?), and IS hot pluggable with the proper
connection (aka Power Plug for Mac), ID's on new drives can be set with
software, a connector the size of a Mac video connector, SGI and HP use SCSI
for all their high end work stations, I think you may have just
floundered......

BTW, this is the second time I have documented how SCSI devices are hot
pluggable to you, Brian. Please cross than one off your list:).

Let me know when you can connect a Barracuda to your USB port.

MG

You don't think that the 400Mb/s sustained transfer rate offered by firewire
is fast enough?

USB is 12Mb/s in high-speed mode. I believe that Peter refered to USB and
firewire. Firewire has a sustained speed of 400Mb/s.

> Seven devices per controller is more than most need,

Most people don't need a lot. Apple has sold a lot of computers with multiple
SCSI connectors (8500, 8600, 9500, 9600, etc.) and a lot of graphics
professionals have added additional SCSI cards to their Macs even though the
computer came with one.

[snipped]

> SGI and HP use SCSI
> for all their high end work stations, I think you may have just

SGI also offers fiber channel as a higher speed connection.

> BTW, this is the second time I have documented how SCSI devices are hot

SCSI can be made to be hot pluggable but you need hardware to do this. With
USB and firewire, no extra hardware is needed. I also believe that you need
extra hardware for each device that you hot plug but I could be wrong.

> Let me know when you can connect a Barracuda to your USB port.

You can already but why would you want to? OTOH, you could have four Barracuda
ST39173W/LW drives and still not saturate firewire.

Yea, it's not that big of an expense. There are a lot of compatible SCSI
devices out there.

Are there firewire hard disk controllers built in now?

Firewire comes built-in with Apple's pro desktop line and the Sony Velo line.
You can also buy PCI firewire cards from several vendors. The Adaptec
HotConnect 8920 is $299. I believe that someone has a 200Mb/s card for $200
(Pinacle?).

there is NO colour synching on the atari, or the IBM(windoze), just the
mac has coloursynching. :-(

: and finally Mac OS X Server.

yeh right. _everyone_ runs a server on their machine. give us a break.
we are talking about a fast efficient multitasking system in everyday use
such as three systems that can be called such on the atari: 1)geneva,
2)MiNT, 3)MagiC and the amiga. I am not sure windoze can be called fast
and efficient, but it at least multitasks, unlike the mac.
try MagiCmac if you want to see fast efficient multitasking on a mac.
you WILL be blown away!

Actually, there are color synching systems for Windows. The problem is that that it is not a system-wide service so you lose all the color synching data on export and it is inconsistent between applications.

> yeh right. _everyone_ runs a server on their machine. give us a break.

The original statement was "And all with true pre-emptive multitasking, which Apple's OS still hasn't accomplished after all these years". I was pointing out that Apple has created preemptive multitasking systems. Actually, they created a preemptive multitasking system (Lisa) before Atari and Amiga did. Also, a lot of people are using Linux on their workstations. I'd bet that there are more Linux workstation deployments than Geneva, MiNT, MagiC and Amiga OS deployments combined. Also the Mac can, of course, multitask. There are several operating systems that are available for the Mac and offer preemptive multitasking: A/UX, AIX, FreeBSD, MkLinux, LinuxPPC, BeOS, Mac OS X Server and MachTen. Have you used the BeOS? You should use the BeOS and MagiC side-by-side for a while.

hmmm - and all of those take up a large amount of hard drive and
RAM space. don't they? Wheras the MagiC operating system takes up a
minimum of two megabytes RAM and about the same hard drive space to
install. Quite amazing when you consider the number of features that
MagiC adds to an Atari (not to mention a Mac when using MagiCMac).

If you want to check out what MagiC is capable of, then I'd suggest
checking out Bengy Collins' web site at http://bengy.atari.org (he even
has a demo copy of MagiCMac online that you can check out for yourself).

As for MacOSX - gee, $995 US just to do something that a
MagiC can do on an Atari for $99 US.....

I think that we all know that preemptive multitasking operating systems can fail in the marketplace. However, the Lisa operating system and hardware were excellent. The problem was that most people weren't willing to pay $15K for it. So Apple started making cheaper hardware and the operating system was redesigned to work in 64K ROM and 128K RAM.

> hmmm - and all of those take up a large amount of hard drive and

Large is relative. Since Linux and the BeOS work nicely on <1K computers, I am not really worried about their "large" resource requirements.

> If you want to check out what MagiC is capable of, then I'd suggest
> checking out Bengy Collins' web site at http://bengy.atari.org (he even

I've used it before; I wasn't particularly impressed.

> As for MacOSX - gee, $995 US just to do something that a
> MagiC can do on an Atari for $99 US.....

Mac OS X Server is, as the name implies, a server operating system. It offers clustering support, AppleShare IP, WebObjects, excellent development tools (IB/PB), a BSD 4.4 implementation (POSIX), the ability to netboot workstations, remote display, etc. For those features, it's not a bad price. And if price is a concern, you can always use Linux.

Not! Considering that the a Mac cpu comes standard with an average of 64M and
6G's..The whole issue of memory and HD is moot..

Sports fans...Whats wrong with this picture? Starting at $1599, the new G3/300 bondi-blue Tower is a bargain....USB, ATI-Rage 128 w/16megs vram and Firewire for low cost digital editing..The Milan according to the specs is stuck with the old and with a price to cry about..

Milan Specs Technical data overview:

Motorola MC 68040 CPU or Motorola MC 68060 CPU (available toward end of 1998) 4 standard PCI slots 3 standard ISA slots 2 IDE interfaces, busmaster-capable VME slot can be upgraded 4 SIMM slots for EDO RAM, max. 512 MB RAM 512 kB Flash-Eprom for operating system, software update possible Standard PC keyboard connection Battery- buffered real time clock 1 parallel port 1 MFP- compatible serial interface (up to 19,200 Baud) 1 PC- compatible serial interface (up to 230,600 Baud) 1.44 MB HD disk drive Base price (Midi tower housing, approx. 1 GB HD drive, 16 MB RAM, 2 MB S3 Trio V64+ graphic card, keyboard, mouse, Milan operating system and TOS 4.5, software bundle): DM 1499

PowerMac Blue G3

Processor
300-, 350-, or 400-MHz PowerPC G3
processor
512K or 1MB backside level 2 cache on
processor, running at 150, 175, or 200
MHz depending on processor speed
100-MHz system bus
Integrated floating-point unit and 64K
on-chip level 1 cache (32K for data and
32K for instruction)

Memory
64MB or 128MB of PC100 SDRAM
(3.3-volt, unbuffered, 64-bit-wide,
168-pin, running at 100 MHz)
Four DIMM slots support up to 1GB of
PC100 SDRAM using the following
DIMMs:
•32MB, 64MB, or 128MB DIMMs
(64-bit-wide, 64-Mbit technology)
•128MB or 256MB DIMMs
(64-bit-wide, 128-Mbit technology)

Storage*
One of the following:
•6GB Ultra ATA hard disk
•12GB Ultra ATA hard disk
•9GB Ultra2 LVD SCSI hard disk with Ultra2 LVD SCSI PCI card
24x-speed (maximum) CD-ROM drive; or
5x-speed (maximum) DVD-ROM drive with DVD-Video playback (reads CD-ROMs at up to 32x speed)
Zip drive (some configurations)
Two additional expansion bays for Ultra Wide SCSI, Ultra2 LVD SCSI, ATA (IDE), Ultra ATA, or ATAPI drives (including CD-ROM, DVD-ROM, and Zip drives)

Interfaces
Connectivity
•Two 400-Mbps FireWire ports
•Two 12-Mbps Universal Serial Bus (USB) ports
•Apple Desktop Bus (ADB) port (maximum current draw for all ADB devices is 500 mA)
Communications
•Built-in 10/100BASE-T Ethernet connector (RJ-45)
•Optional internal 56K modem card (supports K56flex and V.90 standards)**
Expansion
•Four PCI slots: three 64-bit, 33-MHz slots and one 32-bit, 66-MHz slot dedicated to the ATI RAGE 128 graphics card
Video
•15-pin mini D-Sub VGA connector and Macintosh-to-VGA adapter
Sound
•Minijacks for 16-bit stereo audio input and output; 44.1-kHz sampling rate
•Built-in speaker

Graphics support ATI RAGE 128 graphics card with 16MB of SDRAM graphics memory, which provides the following capabilities: 2D performance •128-bit internal engine •Hardware acceleration of graphics and video •Support for up to 1,920- by 1,200-pixel resolution at 32 bits per pixel (millions of colors) 3D performance •Advanced integrated triangle setup engine •Single-pass multitexturing design •Full 32-bit-per- pixel (bpp) Z buffer and 8-bpp stencil buffer •Robust support of QuickDraw 3D RAVE and OpenGL

Keyboard and mouse Apple USB Keyboard

> Milan Specs Technical data overview:

What ever the Mac has, it doesn't matter.
It cannot run TOS software as fast as the Milan.
It is not a TT clone.
It is not 100% Atari compatible.
An equal spec'ed PC can be had for much less, and is easier to find less
expensive software, hardware and service for.

And on top of that, I wouldn't purchase a piece of dog shit that was promoted
by a company that allows fools like you to represent them.

Here is the future for Apple users. Inside a PC box.

As anybody who has read this newsgroup for very long knows, I am a Mac booster. I find the Mac so far ahead of Windows in the arena of ease of use, productivity, and just the sheer pleasure of use, that I find Windows laughable. Those who know me also know that I can be one of Apple's harshest critics. It is in this latter capacity that I write now. Apple has done much to clean up its act, but in one area, they are severely lacking. Customer service. There are many aspects to customer service, but the one that I am addressing has to do with the post purchase upgradability of the new Yosemite Macs. These are marvelous machines, no doubt about it; possibly the best Macs ever made. If one buys one from the Apple store, loaded to the gills, one will have one hell of a computer - as well as an expensive one. The PC buyer, on the other hand, doesn't need to go to Michael Dell, or Gateway to get a custom configured machine, but Mac buyers have to go to the Apple store for one. A PC buyer can go into any of hundreds of stores selling PCs, and tell them EXACTLY what speed, case, HD, CD/DVD, SuperDrives, floppies (one or two?), amount of RAM, what kind of video performance and price range of video card, sound card, on-board modem, brand of processor, etc that they want. The list is seemingly endless. The store will also add all of these options to one's chosen box right there at the point of sale. Even if one buys a Compaq or an HP, the dealer will install a Zip drive, extra memory, a voodoo 2 card

, a soundblaster pro card, whatever the customer wants, right there, while they wait in many cases. Not so with the new G3. EVERYTHING must be ordered at the
Apple store when you order your computer, or you don't get it. Decide after buying that new G3 that you want that $50 SCSI card that was a build option for custom configured machines? Try going to the Apple store AFTER MARKET and ordering one. YOU can't. Ditto the internal modem, or anything else listed as build options for the Yosemite.

Now we get to my saga of the Zip drive. When I decided that I wanted a new Yosemite machine, I ordered it from the Apple Store. I ordered an internal Zip drive, the $50 SCSI card, and the internal modem. It was almost four weeks before I stumbled upon the fact that I could buy the same box, the Apple internal modem, an Adaptek SCSI card (neither installed, but who cares) and get them for almost $400 cheaper than the same box from the Apple Store, have it delivered overnight, and pay NO shipping or CA sales tax. Apple has had me waiting for weeks. needless to say, I called the Apple store and canceled my order. The Zip drive, I hear you wondering. Well, There is a place here in the bay area that has brand new ATAPI EIDE internal Iomega 100 MB Zip drives for $59. Since all the Yosemite boxes come with the mounting bay for a 3.5" removable device (complete with EIDE cable already wired), I figured that I would beat the game and buy the machine Zip-less from Cyberian, and then install one of these $59 specials myself (take THAT, Apple!). Only one problem. When you buy a Zip-less Yosemite box you get a blank blue plastic plate instead of the Zip bezel. No problem, I said, I'll go to my local Apple dealer and order one. Well, easier said than done. I went to two Apple resellers (with in-house repair facilities who order Apple parts all of the time) and asked if they could order one of these bezels. The first one told me that they were unavailable. The second one said that since he had no part number for the piece, that he couldn't order it. I then, in desperation, called Apple Customer Relations. They in turn, called Apple store number two that I had just visited, and read them the riot act (I guess), because when I went back there (at the Apple rep's behest), the repair department manager (the same one who told me that he could not order such a beast) grudgingly took my order (making me pay in advance) And what he made me pay! Guess what Apple is charging for this simple piece of 5.75" X 1.75" blue plastic with a slot in the middle to stick a Zip disk in? $1.00? $5.00? $10.00? EHHHHH! Thanks for playing. Try FORTY ($40) US DOLLARS! Can you say SCREW THE CUSTOMER? This is one aspect of Apple that they have never changed. Any after market Mac items from Apple are sold as "replacement parts" and cost from three to one hundred times what they should cost. Its the reason why upgrade boards for older Macs almost always cost more than the cost of a whole new machine. Apple has never addressed this, and they need to do so, badly.

Apple seems to think that if you want a loaded Mac, then you should buy it all at once. They don't understand that lots of people can just afford a basic configuration, with the idea of adding the bells and whistles that they want later. Apple makes it difficult or impossible to do this, and they always have. PC manufacturers understand this, and understand too

that it is a source of continuing after market income. Why can't Apple? They can't sell these options to you after you've bought one of these machines under any circumstances. You must go through parts where a Zip drive installation kit which adds $100 to the cost of your Mac at the time of sale, becomes a $300 parts item. Hasn't it ever occurred to the people at Apple that somebody might NEED to add a Zip drive that they didn't think that they needed originally, at some point down the road? Apple get a clue.

Comments anyone? (other than the inevitable Wintroll telling me that had I bought a PC, I wouldn't have this problem. I'll save you the trouble. had I bought a new PC, I would have to use Windows. NOTHING is worth stooping to that level. I would also have to buy all new software, Illustrator, Office, Photoshop, FramemMaker, PageMaker QuarkXpress, Etc. That's considerably more than the $40 for a piece of plastic.

I've used 8.5 myself AND MagiC, so I know what I'm talking about.
Whereas, my odious little troll, who has used an Atari ST a grand total
of ONCE, you can only pretend to claim what you claim.

BTW, according to the Apple Rep at ComputerFest this last weekend
in TO, the current iMac still only comes with 32mB RAM standard. All
the reviews I've seen of 8.5 recommend that you go up to 64 megs in
order to actually get things done. KA-CHING!

Strange how I'm getting a lot done with my "old, archaic" Falcon
under MagiC - including doing some scanning work for a friend's web
page project - with a nice hi-res TrueColour display, MagiC/Thing
desktop - that only takes up a total of 4 megs total RAM, about 2 megs
hard drive space, and still have 10 megs of RAM to load lots of
programs in.

>

Actually, Mac OS X Server is a great value for what it is. The problem is that a lot of people don't need it to be all that it is. I, for example, would like to use Mac OS X Server as a workstation operating system so I don't need a WebObjects deployment license, AppleShare IP or netboot capabilities. Many people probably don't even want the development tools. But if you want to use Mac OS X Server at all, you have to pay for everything. It would be nice if Apple would offer a workstation addition for $200 and a development addition for $500.

Friends and fellow Atari Enthusiasts:

It is my distinct pleasure to announce a new streaming Internet radio webcast dedicated to all things Atari. Back In Time ♦ The Radio Webcast has made its debut at http://www.emuclassics.com/backintime.

New episodes will be taped monthly. The show will feature news, reviews, and interviews. (Say that five times fast!) My guest for the first episode is the man STart magazine dubbed ♦The Ultimate Atarian,♦ Donald A. Thomas Jr. Don will be discussing his days at Atari, the Tramiel family, the current state of classic gaming and computing, and Nuon.

The second episode will be posted in early March. Future episodes will feature many people from Atari♦s past, including former Atari employees, hardware/software developers, etc. I will also feature the developers of current Jaguar/Lynx titles, and emulator authors that allow us to recreate the classic gaming and computing experience on the PC♦s used today. Each episode will run for about 30 minutes.

To listen to the show, you will need a PC or Mac, and a copy of the Real Audio player. The Real Audio player is a free download from Real Networks. A link to download the player can be found on the Back In Time web site.

Mike Stulir
Back In Time -- Updated news and complete coverage of ALL things Atari.

Mr Sinclair,
As a long time fan of Atari I must take exception to your continuous line of banter on the merits of the iMac. I feel that a true comparison of machines would be to compare an atari based product with a apple product of equal abilities, You will find no such comparison Your constant drivel and gushing over the iMac reminds one of a neighbor of mine who gushes incesantly about his honda accord. Fine if you like jap cars.... I DON'T. As far as the apps you gush over. In two words WHO CARES. As far as the ATI rage 128 bit card you flap about. You will be saddened to know that the ATI card is an also-ran in the PC world.
Lastly I thought that you might like to know that currently pending before the Md State legislature is a new bill which provides for the ability to file complaints and suits over any form of internet harrassment to include newsgroups AND since you do work for a company with offices in MD. (CompUSA) YOU would be subject litigation filed against CompUSA as a CompUSA representative.
And yes I have copies of your posts for the last year in which the Comp USA name is prominently mentioned.
I am sure that CompUSA could find out who has been associating its good name with your inflamitory remarks.

Oh, quit the legal shit already.
USENET should remain a forum where anyone can have a say, about any
subject, without having to worry about getting sued for expressing a view.

Only in America...

Regards,

Clockmeister.

I believe that Microsoft is not releasing the latest version of Encarta for
the Mac OS and they are considering dropping all future Mac OS development of
Encarta.

Actually, the ATI Fury (which uses the Rage 128 chipset) was just released for the PC and I haven't seen any benchmarks to suggest that it won't be a top tier performer. I will be interesting to see how it performs against the TNT.

Besides office 98, Explorer and Outlook express what other products do MS
develop for the Mac platform? Office 98 is a cash cow for MS.

FYI. Apple bundles World Book on the fruit flavor imacs..

Views are fine and I have no problem with anyone voicing his or her opinion on USENET or any other forum for that matter. I believe in the Constitution, But views should never include statements regarding a company when it is that companies express policy to remain neutral in these matters. And these views must never make the appearance or pretence of having the backing of a specific company when they in fact do not.

Actually I should have checked my facts. The iMac ships with the ATI Rage Pro Turbo which is based on the ATI Rage 2c chip a 64bit chip. This was the processor I was referencing. The actual board mentioned by Mr. Sinclair is the ATI Nexus 128 , a Rage 128 based board. It is indeed fast and a wonderful board, But for the iMac it is unfortunately stunted by the iMac 33Mhz PCI bus. Sorry No 66Mhz AGP 2x implimentation available for the iMac nor 4x AGP v2 slot. And sorry the ATI board is not Cheap in iMac skin.

Gosh Peter did I strike a nerve. Your (what should have been one [1] word [whatever]) reply is the shortest reply I have ever seen you write. Quite out of character, For one so verbose and opinionated.

Harold
its not the hardware but how you use it that counts!

Is that the best you can do?

Peter S.
PowerBook G3/266....14'', 64MB, 4G's, ethernet, 56k, S-Video out....

What planet are you from? You must so totally have missed this "let's
be friends, have fun and exchange knowledge" part of usenet news. Take
some time to discover the thrill of beleiving that you yourself might
not share others opinions and there's no harrasment involved
whatsoever. No one's to say you can't discuss them in an open forum.

And even if that intresting part about you keeping copies of postings
and mentioning it in that manner you do might do wonders to your self
esteem it does not have anything at all to do in this newsgroup.
Neither seem you.

And if you beleive in that legal part I'll insult you any time and you
can try to get me to court.
